Outline

1. Installation
2. Configuration
3. Maintenance
4. Monitoring
5. Recovery
1. Installation

- Click-through Installers
  - MS Windows
  - Linux
  - OS X

- Ports
  - RPM
  - DEB
  - PKG
  - other packages

- Source
  - obtaining
  - build options
  - installing
Initialization (initdb)

$ initdb /u/pgsql/data
The files belonging to this database system will be owned by user "postgres". This user must also own the server process.

The database cluster will be initialized with locale "en_US.UTF-8". The default database encoding has accordingly been set to "UTF8". The default text search configuration will be set to "english".

Data page checksums are disabled.

fixing permissions on existing directory /u/pgsql/data ... ok
creating subdirectories ... ok
selecting default max_connections ... 100
selecting default shared_buffers ... 128MB
selecting dynamic shared memory implementation ... posix
creating configuration files ... ok
running bootstrap script ... ok
performing post-bootstrap initialization ... ok
syncing data to disk ... ok

WARNING: enabling "trust" authentication for local connections
You can change this by editing pg_hba.conf or using the option -A, or --auth-local and --auth-host, the next time you run initdb.

Success. You can now start the database server using:

   pg_ctl -D /u/pgsql/data -l logfile start
$ pg_controldata

Session Creation

[Diagram showing the process of session creation with labels for postmaster, postgres, program (text), data, shared memory, and stack. The diagram illustrates the fork() function and the flow between processes.]
Starting Postmaster

2018-04-15 07:23:18.172 EDT [12055] LOG: listening on IPv4 address "127.0.0.1", port 5432
2018-04-15 07:23:18.188 EDT [12055] LOG: database system is ready to accept connections

- manually
- pg_ctl start
- on boot
Stopping Postmaster

2018-04-15 07:23:47.317 EDT [12055] LOG: received fast shutdown request
2018-04-15 07:23:47.318 EDT [12055] LOG: aborting any active transactions
2018-04-15 07:23:47.327 EDT [12055] LOG: database system is shut down

- manually
- pg_ctl stop
- on shutdown
Connections

- local — unix domain socket
- host — TCP/IP, both SSL or non-SSL
- hostssl — only SSL
- hostnossal — never SSL
Authentication

- trust
- reject
- passwords
  - scram-sha-256
  - md5
  - password (cleartext)
- local authentication
  - socket permissions
  - ’peer’ socket user name passing
  - host ident using local identd
remote authentication
  ➤ host ident using pg_ident.conf
  ➤ kerberos
    ➤ gss
    ➤ sspi
  ➤ pam
  ➤ ldap
  ➤ radius
  ➤ cert
Access

- hostname and network mask
- database name
- role name (user or group)
- filename or list of databases, role
- IPv6
# TYPE DATABASE USER ADDRESS METHOD

2. Configuration

https://www.flickr.com/photos/mwichary/
# -----------------------------
# PostgreSQL configuration file
# -----------------------------
#
# This file consists of lines of the form:
#
#   name = value
#
# (The "=" is optional.) Whitespace may be used. Comments are introduced with
# "#" anywhere on a line. The complete list of parameter names and allowed
# values can be found in the PostgreSQL documentation.
#
# The commented-out settings shown in this file represent the default values.
# Re-commenting a setting is NOT sufficient to revert it to the default value;
# you need to reload the server.
# This file is read on server startup and when the server receives a SIGHUP signal. If you edit the file on a running system, you have to SIGHUP the server for the changes to take effect, run "pg_ctl reload", or execute "SELECT pg_reload_conf()". Some parameters, which are marked below, require a server shutdown and restart to take effect.

# Any parameter can also be given as a command-line option to the server, e.g., "postgres -c log_connections=on". Some parameters can be changed at run time with the "SET" SQL command.

# Memory units: kB = kilobytes
# MB = megabytes
# GB = gigabytes
# TB = terabytes

# Time units: ms = milliseconds
# s = seconds
# min = minutes
# h = hours
# d = days
# The default values of these variables are driven from the -D command-line option or PGDATA environment variable, represented here as ConfigDir.

#data_directory = 'ConfigDir'  # use data in another directory  # (change requires restart)
#hba_file = 'ConfigDir/pg_hba.conf'  # host-based authentication file  # (change requires restart)
#ident_file = 'ConfigDir/pg_ident.conf'  # ident configuration file  # (change requires restart)

# If external_pid_file is not explicitly set, no extra PID file is written.  
#external_pid_file = ''  # write an extra PID file  # (change requires restart)

3. Maintenance
Backup

- File system-level (physical)
  - tar, cpio while shutdown
  - file system snapshot
    - rsync, shutdown, rsync, restart
- pg_dump/pg_dumpall (logical)
- Restore/pg_restore with custom format
Continuous Archiving / Point-In-Time Recovery (PITR)

File System−Level Backup

Continuous Archive (WAL)

02:00

09:00

11:00

13:00
1. `archive_mode = on`
2. `wal_level = archive`
3. `archive_command = 'cp -i %p /mnt/server/pgsql/%f < /dev/null'`
4. `SELECT pg_start_backup('label');`
5. Perform file system-level backup (can be inconsistent)
6. `SELECT pg_stop_backup();`

`pg_basebackup` does this automatically.
PITR Recovery

File System-Level Backup
Continuous Archive (WAL)
PITR Recovery Procedures

1. Stop postmaster
2. Restore file system-level backup
3. Make adjustments as outlined in the documentation
4. Create recovery.conf
5. `restore_command = 'cp /mnt/server/pgsql/%f %p'`
6. Start the postmaster
Simplify backups and WAL archive file management with:

- `pgBackRest`
- `barman`
Data Maintenance

- VACUUM (nonblocking) records free space into .fsm (free space map) files
- ANALYZE collects optimizer statistics
- VACUUM FULL (blocking) shrinks the size of database disk files
Autovacuum handles vacuum and analyze tasks automatically.
Checkpoints

- Write all dirty shared buffers
- Sync all dirty kernel buffers
- Recycle WAL files
- Controlled by `checkpoint_timeout` and `max_wal_size`
4. Monitoring
$ ps -f -Upostgres

External Monitoring Tools

- **Alerting:** check_postgres, tail_n_mail, Nagios
- **Server analysis:** Munin, Cacti, Zabbix, Nagios, MRTG, Prometheus, Grafana
- **Queries:** pg_stat_statements, auto_explain, pgbadger
- **Commercial:** Postgres Enterprise Manager (PEM), Circonus, VividCortex
Monitoring Summary

Reporting

Operating System: vmstat, iostat
Process/Session: ps, top -c, pg_stat_activity
Query: pg_stat_activity.query, log_statement, log_statement_stats
Parser: log_parser_stats
Planner: log_planner_stats
Executor: log_executor_stats, pg_locks, log_lock_waits, pg_stat_activity.wait_event

Alterting / Aggregation

sar, check_postgres, log_temp_files
tail_n_mail
pg_stat_statements, log_min_duration_statement, pgbadger
auto_explain
e.g. pg_stat_all_tables

time
5. Recovery

https://www.flickr.com/photos/coastguardnews/
Client Application Crash

Nothing Required. Transactions in progress are rolled back.
Graceful Postgres Server Shutdown

Nothing Required. Transactions in progress are rolled back.
Nothing Required. Transactions in progress are rolled back.
Nothing Required. Transactions in progress are rolled back. Partial page writes are repaired.
Disk Failure

Restore from previous backup or use PITR.
Accidental DELETE

Recover table from previous backup, perhaps using pg_restore. It is possible to modify the backend code to make deleted tuples visible, dump out the deleted table and restore the original code. All tuples in the table since the previous vacuum will be visible. It is possible to restrict that so only tuples deleted by a specific transaction are visible.
See pg_resetwal. Review recent transactions and identify any damage, including partially committed transactions.
It may be necessary to create an empty file with the deleted file name so the object can be deleted, and then the object restored from backup.
Accidental DROP TABLE

Restore from previous backup.
Accidental DROP INDEX

Recreate index.
Accidental DROP DATABASE

Restore from previous backup.
Restart problems are usually caused by write-ahead log problems. See pg_resetwal. Review recent transactions and identify any damage, including partially committed transactions.
Use REINDEX.
Try reindexing the table. Try identifying the corrupt OID of the row and transfer the valid rows into another table using 
SELECT...INTO...WHERE oid != ###. Use pageinspect to analyze the internal structure of the table.
Conclusion
