The optimizer is the "brain" of the database, interpreting SQL queries and determining the fastest method of execution. This talk uses the EXPLAIN command to show how the optimizer interprets queries and determines optimal execution.

- Nodes / Lists
Postgres Query Execution

1. Parse Statement
2. Traffic Cop
3. Rewrite Query
4. Generate Paths
5. Optimal Path
6. Generate Plan
7. Execute Plan
8. Utility Command

- Query
  - SELECT, INSERT, UPDATE, DELETE
- Utility
  - e.g. CREATE TABLE, COPY
The Optimizer Is the Brain

https://www.flickr.com/photos/dierkschaefer/
What Decisions Does the Optimizer Have to Make?

- Scan Method
- Join Method
- Join Order
Which Scan Method?

- Sequential Scan
- Bitmap Index Scan
- Index Scan
A Simple Example Using `pg_class.relname`

```sql
SELECT relname
FROM pg_class
ORDER BY 1
LIMIT 8;
```

```
relname
-----------------------------------
_pg_foreign_data_wrappers
_pg_foreign_servers
_pg_user_mappings
administrable_role_authorizations
applicable_roles
attributes
check_constraint_routine_usage
check_constraints
```
Let’s Use Just the First Letter of *pg_class.relname*

```sql
SELECT substring(relname, 1, 1)
FROM pg_class
ORDER BY 1
LIMIT 8;
```

<table>
<thead>
<tr>
<th>substring</th>
</tr>
</thead>
<tbody>
<tr>
<td>_</td>
</tr>
<tr>
<td>_</td>
</tr>
<tr>
<td>_</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td>c</td>
</tr>
<tr>
<td>c</td>
</tr>
</tbody>
</table>
CREATE TEMPORARY TABLE sample (letter, junk) AS
    SELECT substring(relname, 1, 1), repeat('x', 250)
    FROM pg_class
    ORDER BY random(); -- add rows in random order

CREATE INDEX i_sample on sample (letter);

All queries used in this presentation are available at http://momjian.us/main/writings/pgsql/optimizer.sql.
CREATE OR REPLACE FUNCTION lookup_letter(text) RETURNS SETOF text AS $$
BEGIN
RETURN QUERY EXECUTE 'EXPLAIN SELECT letter
FROM sample
WHERE letter = ''' || $1 || '''';
END
$$ LANGUAGE plpgsql;
What is the Distribution of the *sample* Table?

WITH letters (letter, count) AS (
    SELECT letter, COUNT(*)
    FROM sample
    GROUP BY 1
)

SELECT letter, count, (count * 100.0 / (SUM(count) OVER ()))::numeric(4,1) AS "%"
FROM letters
ORDER BY 2 DESC;
What is the Distribution of the *sample* Table?

| letter | count | %  |
|--------+-------+----|
| p      | 199   | 78.7|
| s      | 9     | 3.6 |
| c      | 8     | 3.2 |
| r      | 7     | 2.8 |
| t      | 5     | 2.0 |
| v      | 4     | 1.6 |
| f      | 4     | 1.6 |
| d      | 4     | 1.6 |
| u      | 3     | 1.2 |
| a      | 3     | 1.2 |
| _      | 3     | 1.2 |
| e      | 2     | 0.8 |
| i      | 1     | 0.4 |
| k      | 1     | 0.4 |
Is the Distribution Important?

```sql
EXPLAIN SELECT letter
FROM sample
WHERE letter = 'p';
```

**QUERY PLAN**

```
Index Scan using i_sample on sample  (cost=0.00..8.27 rows=1 width=32)
  Index Cond: (letter = 'p'::text)
```
EXPLAIN SELECT letter
FROM sample
WHERE letter = 'd';

QUERY PLAN

Index Scan using i_sample on sample (cost=0.00..8.27 rows=1 width=32)
  Index Cond: (letter = 'd'::text)
Is the Distribution Important?

EXPLAIN SELECT letter
FROM sample
WHERE letter = 'k';

QUERY PLAN

-- Index Scan using i_sample on sample  (cost=0.00..8.27 rows=1 width=32)
  Index Cond: (letter = 'k'::text)
Running \texttt{ANALYZE} Causes a Sequential Scan for a Common Value

\begin{verbatim}
ANALYZE sample;

EXPLAIN SELECT letter
FROM sample
WHERE letter = 'p';
\end{verbatim}

\textbf{QUERY PLAN}

\begin{verbatim}
Seq Scan on sample  (cost=0.00..13.16 rows=199 width=2)
  Filter: (letter = 'p'::text)
\end{verbatim}

Autovacuum cannot \texttt{ANALYZE} (or \texttt{VACUUM}) temporary tables because these tables are only visible to the creating session.
Sequential Scan

Heap

D A T A A T T T A A T T A T T T A A T T T A A T T T A A T T T A A T T T A A T T T A A T T T A A T T T A A T T T A
A Less Common Value Causes a Bitmap Index Scan

EXPLAIN SELECT letter
FROM sample
WHERE letter = 'd';

QUERY PLAN

-----------------------------------------------------------------------
Bitmap Heap Scan on sample (cost=4.28..12.74 rows=4 width=2)
  Recheck Cond: (letter = 'd'::text)
  -> Bitmap Index Scan on i_sample (cost=0.00..4.28 rows=4 width=0)
     Index Cond: (letter = 'd'::text)
Bitmap Index Scan

Index 1  Index 2  Combined

| 0 | 0 | 0 |
| 1 | 1 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |

&

Table

\('A' AND 'NS'\)
EXPLAIN SELECT letter
FROM sample
WHERE letter = 'k';

QUERY PLAN

Index Scan using i_sample on sample (cost=0.00..8.27 rows=1 width=2)
  Index Cond: (letter = 'k'::text)
Let’s Look at All Values and their Effects

Which Join Method?

- Nested Loop
  - With Inner Sequential Scan
  - With Inner Index Scan
- Hash Join
- Merge Join
What Is in `pg_proc.oid`?

```
SELECT oid
FROM pg_proc
ORDER BY 1
LIMIT 8;

<table>
<thead>
<tr>
<th>oid</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>33</td>
</tr>
<tr>
<td>34</td>
</tr>
<tr>
<td>35</td>
</tr>
<tr>
<td>38</td>
</tr>
<tr>
<td>39</td>
</tr>
<tr>
<td>39</td>
</tr>
<tr>
<td>40</td>
</tr>
<tr>
<td>41</td>
</tr>
</tbody>
</table>
```
Create Temporary Tables from *pg_proc* and *pg_class*

CREATE TEMPORARY TABLE sample1 (id, junk) AS
    SELECT oid, repeat('x', 250)
    FROM pg_proc
    ORDER BY random();  -- add rows in random order

CREATE TEMPORARY TABLE sample2 (id, junk) AS
    SELECT oid, repeat('x', 250)
    FROM pg_class
    ORDER BY random();  -- add rows in random order

These tables have no indexes and no optimizer statistics.
Join the Two Tables with a Tight Restriction

EXPLAIN SELECT sample2.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id)
WHERE sample1.id = 33;

QUERY PLAN

---------------------------------------------------------------------
Nested Loop  (cost=0.00..234.68 rows=300 width=32)
  ->  Seq Scan on sample1  (cost=0.00..205.54 rows=50 width=4)
      Filter: (id = 33::oid)
  ->  Materialize  (cost=0.00..25.41 rows=6 width=36)
      ->  Seq Scan on sample2  (cost=0.00..25.38 rows=6 width=36)
          Filter: (id = 33::oid)
---------------------------------------------------------------------
Nested Loop Join with Inner Sequential Scan

Outer

- aag
- aay
- aar
- aai

Inner

- aai
- aag
- aas
- aar
- aay
- aaa
- aag

No Setup Required

Used For Small Tables
Pseudocode for Nested Loop Join with Inner Sequential Scan

for (i = 0; i < length(outer); i++)
    for (j = 0; j < length(inner); j++)
        if (outer[i] == inner[j])
            output(outer[i], inner[j]);
EXPLAIN SELECT sample1.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id)
WHERE sample2.id > 33;

QUERY PLAN

Hash Join (cost=30.50..950.88 rows=20424 width=32)
  Hash Cond: (sample1.id = sample2.id)
  -> Seq Scan on sample1 (cost=0.00..180.63 rows=9963 width=36)
  -> Hash (cost=25.38..25.38 rows=410 width=4)
    -> Seq Scan on sample2 (cost=0.00..25.38 rows=410 width=4)
      Filter: (id > 33::oid)
Hash Join

**Outer**

- aay
- aag
- aak
- aar

**Inner**

- aak → aas
- aam → aay → aar
- aao → aaw

Hashed

Must fit in Main Memory
Pseudocode for Hash Join

for (j = 0; j < length(inner); j++)
    hash_key = hash(inner[j]);
    append(hash_store[hash_key], inner[j]);
for (i = 0; i < length(outer); i++)
    hash_key = hash(outer[i]);
    for (j = 0; j < length(hash_store[hash_key]); j++)
        if (outer[i] == hash_store[hash_key][j])
            output(outer[i], inner[j]);
Join the Two Tables with No Restriction

EXPLAIN SELECT sample1.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id);

QUERY PLAN

<table>
<thead>
<tr>
<th>Plan Type</th>
<th>Cost (Estimate)</th>
<th>Rows</th>

| -> Seq Scan on sample2 (cost=0.00..13.25 rows=1 width=258) |
| Filter: (junk ~ '^aaa'::text) |
| -> Index Scan using i_sample1 on sample1 (cost=0.00..8.27 rows=1 width=4) |
| Index Cond: (sample1.id = sample2.id) |

No *junk* rows begin with ’aaa’.
All 'junk' Columns Begin with 'xxx'

EXPLAIN SELECT sample2.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id)
WHERE sample2.junk ~ '^xxx';

QUERY PLAN

Hash Join  (cost=16.50..131.12 rows=260 width=254)
  Hash Cond: (sample1.id = sample2.id)
    ->  Seq Scan on sample1  (cost=0.00..103.56 rows=2256 width=4)
    ->  Hash  (cost=13.25..13.25 rows=260 width=258)
      ->  Seq Scan on sample2  (cost=0.00..13.25 rows=260 width=258)
        Filter: (junk ~ '^xxx'::text)

Hash join was chosen because many more rows are expected. The smaller table, e.g., sample2, is always hashed.
Without LIMIT, Hash Is Used for this Unrestricted Join

EXPLAIN SELECT sample2.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id);

QUERY PLAN

Hash Join  (cost=15.85..130.47 rows=260 width=254)
 Hash Cond: (sample1.id = sample2.id)
  ->  Seq Scan on sample1  (cost=0.00..103.56 rows=2256 width=4)
  ->  Hash  (cost=12.60..12.60 rows=260 width=258)
       ->  Seq Scan on sample2  (cost=0.00..12.60 rows=260 width=258)
LIMIT Can Affect Join Usage

```
EXPLAIN SELECT sample2.id, sample2.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id)
ORDER BY 1
LIMIT 1;
```

**QUERY PLAN**

```
Limit (cost=0.00..1.83 rows=1 width=258)
  -> Nested Loop (cost=0.00..477.02 rows=260 width=258)
    -> Index Scan using i_sample2 on sample2 (cost=0.00..52.15 rows=260 width=258)
    -> Index Scan using i_sample1 on sample1 (cost=0.00..1.62 rows=1 width=4)
      Index Cond: (sample1.id = sample2.id)
```
EXPLAIN SELECT sample2.id, sample2.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id)
ORDER BY 1
LIMIT 10;

QUERY PLAN

Limit (cost=0.00..18.35 rows=10 width=258)
  -> Nested Loop (cost=0.00..477.02 rows=260 width=258)
    -> Index Scan using i_sample2 on sample2 (cost=0.00..52.15 rows=260 width=258)
    -> Index Scan using i_sample1 on sample1 (cost=0.00..1.62 rows=1 width=4)
      Index Cond: (sample1.id = sample2.id)
LIMIT 100 Switches to Hash Join

EXPLAIN SELECT sample2.id, sample2.junk
FROM sample1 JOIN sample2 ON (sample1.id = sample2.id)
ORDER BY 1
LIMIT 100;

QUERY PLAN

--------------------------------------------------------------------
| Limit  (cost=140.41..140.66 rows=100 width=258)  |
|   -> Sort  (cost=140.41..141.06 rows=260 width=258)  |
|       Sort Key: sample2.id  |
|       -> Hash Join  (cost=15.85..130.47 rows=260 width=258)  |
|           Hash Cond: (sample1.id = sample2.id)  |
|           -> Seq Scan on sample1  (cost=0.00..103.56 rows=2256 width=4)  |
|           -> Hash  (cost=12.60..12.60 rows=260 width=258)  |
|               -> Seq Scan on sample2  (cost=0.00..12.60 rows=260 width=258)  |
--------------------------------------------------------------------
