Rapid Upgrades With Pg_Upgrade

BRUCE MOMJIAN

Pg_Upgrade allows migration between major releases of Postgres without a data dump/reload. This presentation explains how pg_upgrade works.

Traditional Postgres Major Upgrade Options

- ► Minor upgrades are simple
- pg_dump (logical dump)/restore
- ► Slony

Why Major Upgrades of Postgres Are Complex

- ▶ New features often require system table changes
- ► However, the internal data format rarely changes

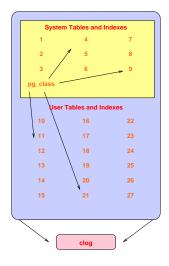

Why Pg_Upgrade

- Very fast upgrades
- Optionally no additional disk space

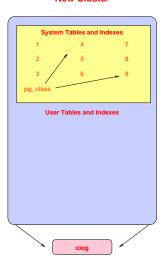

pg_upgrade installs new system tables while using data files from the previous Postgres version.

How It Works: Initial Setup

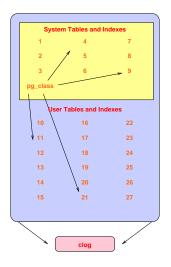

New Cluster

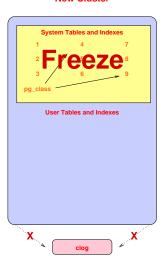

Decouple New Clog Via Freezing

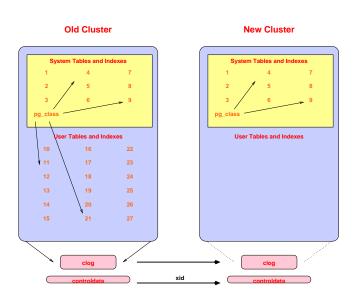

Old Cluster

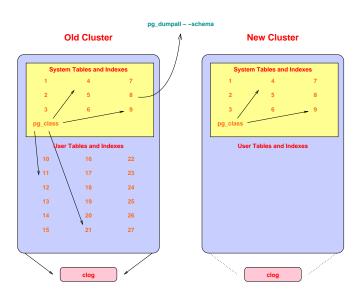

New Cluster

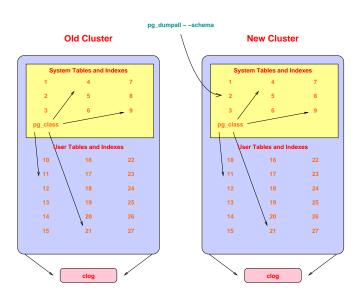

Transfer Clog and XID

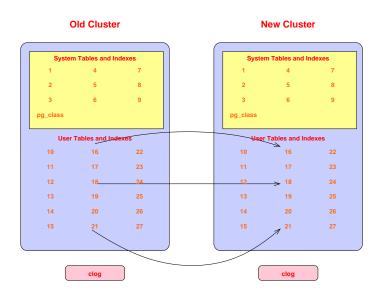

Get Schema Dump

Restore Schema In New Cluster

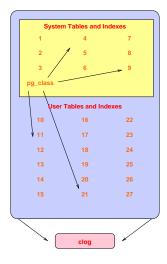

Copy User Heap/Index Files

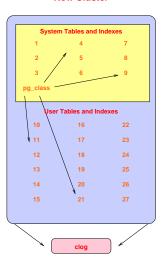

Complete

Old Cluster

New Cluster

How It Works: In Detail

- Check for cluster compatability
 - locale
 - encoding
- Use pg_dumpall to dump old cluster schema (no data)
- ► Freeze all new cluster rows (remove reference to clog entries)
- ► New cluster uses old xid counter value (see freeze above)
 - Set system table frozen xids to match the current xid
- Create new users/databases
- Collect cluster information
- Install support functions that call internal backend functions
- Create schema in new cluster
- Copy or link files from old cluster to new cluster
- Warn about any remaining issues, like REINDEX requirements

Sample Run: Performing Consistency Checks

$\hbox{Performing Consistency Checks}$

Checking	current, bin, and data directories	ok
Checking	cluster versions	ok
Checking	database user is a superuser	ok
Checking	for prepared transactions	ok
Checking	for reg* system OID user data types	ok
Checking	for invalid indexes from concurrent index builds	ok
Checking	for contrib/isn with bigint-passing mismatch	ok
Creating	catalog dump	ok
Checking	for presence of required libraries	ok
Checking	database user is a superuser	ok
Checking	for prepared transactions	ok

If pg_upgrade fails after this point, you must re-initdb the new cluster before continuing.

Sample Run: Performing Migration

Performing Upgrade

Analyzing all rows in the new cluster οk Freezing all rows on the new cluster οk Deleting files from new pg clog ok Copying old pg clog to new server οk Setting next transaction ID for new cluster ok Resetting WAL archives ok Setting frozenxid counters in new cluster οk Creating databases in the new cluster ok Adding support functions to new cluster nk Restoring database schema to new cluster οk Removing support functions from new cluster ok Adding ".old" suffix to old global/pg control ok

If you want to start the old cluster, you will need to remove the ".old" suffix from /u/pgsql.old/data/global/pg_control.old. Because "link" mode was used, the old cluster cannot be safely started once the new cluster has been started.

Sample Run: Completion

Linking user relation files

Setting next OID for new cluster ok
Creating script to analyze new cluster ok
Creating script to delete old cluster ok

Upgrade Complete

Optimizer statistics are not transferred by pg_upgrade so, once you start the new server, consider running:

analyze new cluster.sh

Running this script will delete the old cluster's data files: delete old cluster.sh

Possible Data Format Changes

Change	Conversion Method	
clog	none	
heap page header, including bitmask	convert to new page format on read	
tuple header, including bitmask	convert to new page format on read	
data value format	create old data type in new cluster	
index page format	reindex, or recreate index methods	
TOAST page format	convert to new page format on read	

Speed Comparison

Migration Method	Minutes
dump/restore	300.0
dump with parallel restore	180.0
pg_upgrade in copy mode	44.0
pg_upgrade in link mode	0.7

Database size: 150GB, 850 tables

The last duration is 44 seconds.

Timings courtesy of Stefan Kaltenbrunner (mastermind on IRC)

Release History

- ▶ 9.0 focused on stability
- ▶ 9.1 focused on performance for databases with many relations
- ▶ 9.2 focused on improved debugging and reliability for non-standard configurations
- ▶ 9.3 focused on performance via parallelism and reduced fsync activity
- ▶ 9.4 dramatically reduced memory usage

Conclusion
