

# Mastering PostgreSQL Administration

BRUCE MOMJIAN

POSTGRES SQL is an open-source, full-featured relational database.  
This presentation covers advanced administration topics.

*Creative Commons Attribution License*

*Last updated: September, 2017*

# Outline

1. Installation
2. Configuration
3. Maintenance
4. Monitoring
5. Recovery

# Installation

- ▶ Click-through Installers
  - ▶ MS Windows
  - ▶ Linux
  - ▶ OS X
- ▶ Ports
  - ▶ RPM
  - ▶ DEB
  - ▶ PKG
  - ▶ other packages
- ▶ Source
  - ▶ obtaining
  - ▶ build options
  - ▶ installing

# Initialization (initdb)

```
$ initdb
```

```
All of PostgreSQL successfully made. Ready to install.
```

```
PostgreSQL installation complete.
```

```
The files belonging to this database system will be owned by user "postgres".
```

```
This user must also own the server process.
```

```
The database cluster will be initialized with locale "en_US.UTF-8".
```

```
The default database encoding has accordingly been set to "UTF8".
```

```
The default text search configuration will be set to "english".
```

```
Data page checksums are disabled.
```

```
fixing permissions on existing directory /u/pgsql/data ... ok
```

```
creating subdirectories ... ok
```

```
selecting default max_connections ... 100
```

```
selecting default shared_buffers ... 128MB
```

```
selecting dynamic shared memory implementation ... posix
```

```
creating configuration files ... ok
```

```
running bootstrap script ... ok
```

```
performing post-bootstrap initialization ... ok
```

```
syncing data to disk ... ok
```

```
WARNING: enabling "trust" authentication for local connections
```

```
You can change this by editing pg_hba.conf or using the option -A, or
```

```
--auth-local and --auth-host, the next time you run initdb.
```

# System Architecture

# Starting Postmaster

```
LOG: database system was shut down at 2012-01-24 09:33:29 EST  
LOG: database system is ready to accept connections  
LOG: autovacuum launcher started
```

- ▶ manually
- ▶ `pg_ctl start`
- ▶ on boot

# Stopping Postmaster

```
LOG: received smart shutdown request  
LOG: autovacuum launcher shutting down  
LOG: shutting down  
LOG: database system is shut down
```

- ▶ manually
- ▶ `pg_ctl stop`
- ▶ on shutdown

# Connections

- ▶ local — unix domain socket
- ▶ host — TCP/IP, both SSL or non-SSL
- ▶ hostssl — only SSL
- ▶ hostnossll — never SSL

# Authentication

- ▶ trust
- ▶ reject
- ▶ passwords
  - ▶ md5
  - ▶ password (cleartext)
- ▶ local authentication
  - ▶ socket permissions
  - ▶ 'peer' socket user name passing
  - ▶ host ident using local identd

# Authentication (continued)

- ▶ remote authentication
  - ▶ host ident using pg\_ident.conf
  - ▶ kerberos
    - ▶ gss
    - ▶ sspi
  - ▶ pam
  - ▶ ldap
  - ▶ radius
  - ▶ cert

# Access

- ▶ hostname and network mask
- ▶ database name
- ▶ role name (user or group)
- ▶ filename or list of databases, role
- ▶ IPv6

# pg\_hba.conf Default

```
# TYPE DATABASE USER ADDRESS METHOD

# "local" is for Unix domain socket connections only
local all all trust
# IPv4 local connections:
host all all 127.0.0.1/32 trust
# IPv6 local connections:
host all all ::1/128 trust
# Allow replication connections from localhost, by a user with the
# replication privilege.
#local replication postgres trust
#host replication postgres 127.0.0.1/32 trust
#host replication postgres ::1/128 trust
```

# pg\_hba.conf Example

```
# TYPE      DATABASE      USER      ADDRESS      METHOD

# "local" is for Unix domain socket connections only
local      all          all              trust

# IPv4 local connections:
host       all          all          127.0.0.1/32  trust

# IPv6 local connections:
host       all          all          ::1/128       trust

# disable connections from the gateway machine
host       all          all          192.168.1.254/32  reject

# enable local network
host       all          all          192.168.1.0/24   md5

# require SSL for external connections, but do not allow the superuser
hostssl    all          postgres      0.0.0.0/0       reject
hostssl    all          all           0.0.0.0/0       md5
```

# Permissions

- ▶ Host connection permissions
- ▶ Role permissions
  - ▶ create roles
  - ▶ create databases
  - ▶ table permissions
- ▶ Database management
  - ▶ template1 customization
  - ▶ system tables
  - ▶ disk space computations

# Configuration of postgresql.conf

<https://www.flickr.com/photos/mwichary/>

# postgresql.conf

```
# -----  
# PostgreSQL configuration file  
# -----  
#  
# This file consists of lines of the form:  
#  
#   name = value  
#  
# (The "=" is optional.)  Whitespace may be used.  Comments are introduced with  
# "#" anywhere on a line.  The complete list of parameter names and allowed  
# values can be found in the PostgreSQL documentation.  
#  
# The commented-out settings shown in this file represent the default values.  
# Re-commenting a setting is NOT sufficient to revert it to the default value;  
# you need to reload the server.
```

# postgresql.conf (Continued)

```
# This file is read on server startup and when the server receives a SIGHUP
# signal.  If you edit the file on a running system, you have to SIGHUP the
# server for the changes to take effect, or use "pg_ctl reload".  Some
# parameters, which are marked below, require a server shutdown and restart to
# take effect.
#
# Any parameter can also be given as a command-line option to the server, e.g.,
# "postgres -c log_connections=on".  Some parameters can be changed at run time
# with the "SET" SQL command.
#
# Memory units:  kB = kilobytes           Time units:  ms = milliseconds
#                MB = megabytes           s           = seconds
#                GB = gigabytes           min          = minutes
#                TB = terabytes           h           = hours
#                                           d           = days
```

# Configuration File Location

```
# The default values of these variables are driven from the -D command-line  
# option or PGDATA environment variable, represented here as ConfigDir.
```

```
#data_directory = 'ConfigDir'           # use data in another directory  
                                           # (change requires restart)  
#hba_file = 'ConfigDir/pg_hba.conf'     # host-based authentication file  
                                           # (change requires restart)  
#ident_file = 'ConfigDir/pg_ident.conf' # ident configuration file  
                                           # (change requires restart)
```

```
# If external_pid_file is not explicitly set, no extra PID file is written.  
#external_pid_file = ''                 # write an extra PID file  
                                           # (change requires restart)

# Maintenance

# Backup

- ▶ File system-level (physical)
  - ▶ tar, cpio while shutdown
  - ▶ file system snapshot
  - ▶ rsync, shutdown, rsync, restart
- ▶ pg\_dump/pg\_dumpall (logical)
- ▶ Restore/pg\_restore with custom format

# Continuous Archiving / Point-In-Time Recovery (PITR)

# PITR Backup Procedures

1. `archive_mode = on`
2. `wal_level = archive`
3. `archive_command = 'cp -i %p /mnt/server/pgsql/%f < /dev/null'`
4. `SELECT pg_start_backup('label');`
5. Perform file system-level backup (can be inconsistent)
6. `SELECT pg_stop_backup();`

`pg_basebackup` does this automatically and can be run on version 9.2+ standbys.

# PITR Recovery

# PITR Recovery Procedures

1. Stop postmaster
2. Restore file system-level backup
3. Make adjustments as outlined in the documentation
4. Create recovery.conf
5. `restore_command = 'cp /mnt/server/pgsql/%f %p'`
6. Start the postmaster

# Data Maintenance

- ▶ VACUUM (nonblocking) records free space into .fsm (free space map) files
- ▶ ANALYZE collects optimizer statistics
- ▶ VACUUM FULL (blocking) shrinks the size of database disk files

# Automating Tasks

Autovacuum handles vacuum and analyze tasks automatically.

# Checkpoints

- ▶ Write all dirty shared buffers
- ▶ Sync all dirty kernel buffers
- ▶ Recycle WAL files
- ▶ Check for server messages indicating too-frequent checkpoints
- ▶ If so, increase *checkpoint\_segments*

# Monitoring Active Sessions

# Recovery

<https://www.flickr.com/photos/coastguardnews/>

# Client Application Crash

Nothing Required. Transactions in progress are rolled back.

# Graceful Postgres Server Shutdown

Nothing Required. Transactions in progress are rolled back.

# Abrupt Postgres Server Crash

Nothing Required. Transactions in progress are rolled back.

# Operating System Crash

Nothing Required. Transactions in progress are rolled back.  
Partial page writes are repaired.

# Disk Failure

Restore from previous backup or use PITR.

# Accidental DELETE

Recover table from previous backup, perhaps using `pg_restore`. It is possible to modify the backend code to make deleted tuples visible, dump out the deleted table and restore the original code. All tuples in the table since the previous vacuum will be visible. It is possible to restrict that so only tuples deleted by a specific transaction are visible.

# Write-Ahead Log (WAL) Corruption

See `pg_resetxlog`. Review recent transactions and identify any damage, including partially committed transactions.

# File Deletion

It may be necessary to create an empty file with the deleted file name so the object can be deleted, and then the object restored from backup.

# Accidental DROP TABLE

Restore from previous backup.

# Accidental DROP INDEX

Recreate index.

# Accidental DROP DATABASE

Restore from previous backup.

# Non-Starting Installation

Restart problems are usually caused by write-ahead log problems. See `pg_resetxlog`. Review recent transactions and identify any damage, including partially committed transactions.

# Index Corruption

Use REINDEX.

# Table Corruption

Try reindexing the table. Try identifying the corrupt OID of the row and transfer the valid rows into another table using `SELECT...INTO...WHERE oid != ###`. Use <http://sources.redhat.com/rhdb/tools.html> to analyze the internal structure of the table.

# Conclusion

*<http://momjian.us/presentations>*
