5. Recovery
1. Installation

- Click-through Installers
  - MS Windows
  - Linux
  - OS X

- Ports
  - RPM
  - DEB
  - PKG
  - other packages

- Source
  - obtaining
  - build options
  - installing
$ initdb /u/pgsql/data
The files belonging to this database system will be owned by user "postgres".
This user must also own the server process.

The database cluster will be initialized with locale "en_US.UTF-8".
The default database encoding has accordingly been set to "UTF8".
The default text search configuration will be set to "english".

Data page checksums are disabled.

fixing permissions on existing directory /u/pgsql/data ... ok
creating subdirectories ... ok
selecting default max_connections ... 100
selecting default shared_buffers ... 128MB
selecting dynamic shared memory implementation ... posix
creating configuration files ... ok
running bootstrap script ... ok
performing post-bootstrap initialization ... ok
syncing data to disk ... ok

WARNING: enabling "trust" authentication for local connections
You can change this by editing pg_hba.conf or using the option -A, or
--auth-local and --auth-host, the next time you run initdb.

Success. You can now start the database server using:

    pg_ctl -D /u/pgsql/data -l logfile start
pg_controldata

Starting Postmaster

- manually
- `pg_ctl start`
- on boot
Stopping Postmaster

- manually
- pg_ctl stop
- on shutdown
Connections

- local — unix domain socket
- host — TCP/IP, both SSL or non-SSL
- hostssl — only SSL
- hostnossl — never SSL
Authentication

- trust
- reject
- passwords
  - scram-sha-256
  - md5
  - password (cleartext)
- local authentication
  - socket permissions
  - ’peer’ socket user name passing
  - host ident using local identd
remote authentication
  ▶ host ident using pg_ident.conf
  ▶ kerberos
    ▶ gss
    ▶ sspi
  ▶ pam
  ▶ ldap
  ▶ radius
  ▶ cert
Access

- hostname and network mask
- database name
- role name (user or group)
- filename or list of databases, role
- IPv6

2. Configuration

https://www.flickr.com/photos/mwichary/
# PostgreSQL configuration file
#
# This file consists of lines of the form:
#
#      name = value
#
# (The "=" is optional.) Whitespace may be used. Comments are introduced with
# "#" anywhere on a line. The complete list of parameter names and allowed
# values can be found in the PostgreSQL documentation.
#
# The commented-out settings shown in this file represent the default values.
# Re-commenting a setting is NOT sufficient to revert it to the default value;
# you need to reload the server.
This file is read on server startup and when the server receives a SIGHUP signal. If you edit the file on a running system, you have to SIGHUP the server for the changes to take effect, run "pg_ctl reload", or execute "SELECT pg_reload_conf()". Some parameters, which are marked below, require a server shutdown and restart to take effect.

Any parameter can also be given as a command-line option to the server, e.g., "postgres -c log_connections=on". Some parameters can be changed at run time with the "SET" SQL command.

Memory units: kB = kilobytes Time units: ms = milliseconds
MB = megabytes s = seconds
GB = gigabytes min = minutes
TB = terabytes h = hours
d = days
# The default values of these variables are driven from the -D command-line option or PGDATA environment variable, represented here as ConfigDir.

`#data_directory = 'ConfigDir'`  # use data in another directory  # (change requires restart)

`#hba_file = 'ConfigDir/pg_hba.conf'`  # host-based authentication file  # (change requires restart)

`#ident_file = 'ConfigDir/pg_ident.conf'`  # ident configuration file  # (change requires restart)

`# If external_pid_file is not explicitly set, no extra PID file is written.  #external_pid_file = ''  # write an extra PID file  # (change requires restart)"

# Sizing Shared Memory

A diagram showing the memory allocation with different sections:

- **Kernel Disk Buffer Cache**
- **Shared Buffer Cache (shared_buffers)**
- **Postgres Session (work_mem)**
- **Free**
- **Kernel**

There is also a section labeled **Swap** with arrows indicating page in and page out operations.
# - Disk -

#temp_file_limit = -1  # limits per-process temp file space
# in kB, or -1 for no limit

# - Kernel Resource Usage -

#max_files_per_process = 1000  # min 25
# (change requires restart)
#shared_preload_libraries = ''  # (change requires restart)
Vacuum and Background Writer

# - Cost-Based Vacuum Delay -

```sql
#vacuum_cost_delay = 0  # 0-100 milliseconds
#vacuum_cost_page_hit = 1  # 0-10000 credits
#vacuum_cost_page_miss = 10  # 0-10000 credits
#vacuum_cost_page_dirty = 20  # 0-10000 credits
#vacuum_cost_limit = 200  # 1-10000 credits
```

# - Background Writer -

```sql
#bgwriter_delay = 200ms  # 10-10000ms between rounds
#bgwriter_lru_maxpages = 100  # 0-1000 max buffers written/round
#bgwriter_lru_multiplier = 2.0  # 0-10.0 multiplier on buffers scanned/round
#bgwriter_flush_after = 512kB  # measured in pages, 0 disables
```

# - Asynchronous Behavior -

```sql
#effective_io_concurrency = 1  # 1-1000; 0 disables prefetching
#max_worker_processes = 8  # (change requires restart)
#max_parallel_workers_per_gather = 2  # taken from max_parallel_workers
#max_parallel_workers = 8  # maximum number of max_worker_processes that can be used in parallel queries
#old_snapshot_threshold = -1  # 1min-60d; -1 disables; 0 is immediate
```
Write-Ahead Log (WAL)

3. Maintenance
Backup

- File system-level (physical)
  - tar, cpio while shutdown
  - file system snapshot
    - rsync, shutdown, rsync, restart
- pg_dump/pg_dumpall (logical)
- Restore/pg_restore with custom format
Continuous Archiving / Point-In-Time Recovery (PITR)

File System-Level Backup
Continuous Archive (WAL)
PITR Backup Procedures

1. `archive_mode = on`
2. `wal_level = archive`
3. `archive_command = 'cp -i %p /mnt/server/pgsql/%f < /dev/null'`
4. `SELECT pg_start_backup('label');`
5. Perform file system-level backup (can be inconsistent)
6. `SELECT pg_stop_backup();`

`pg_basebackup` does this automatically.
PITR Recovery

File System–Level Backup
Continuous Archive (WAL)
1. Stop postmaster
2. Restore file system-level backup
3. Make adjustments as outlined in the documentation
4. Create recovery.conf
5. `restore_command = 'cp /mnt/server/pgsql/%f %p'`
6. Start the postmaster
Continuous Archive Management

Simplify backups and WAL archive file management with:

- *pgBackRest*
- *barman*
Data Maintenance

- **VACUUM** (nonblocking) records free space into .fsm (free space map) files
- **ANALYZE** collects optimizer statistics
- **VACUUM FULL** (blocking) shrinks the size of database disk files
Autovacuum handles vacuum and analyze tasks automatically.
Checkpoints

- Write all dirty shared buffers
- Sync all dirty kernel buffers
- Recycle WAL files
- Controlled by `checkpoint_timeout` and `max_wal_size`
4. Monitoring
$ ps -f -U postgres

time
5. Recovery

https://www.flickr.com/photos/coastguardnews/
Nothing Required. Transactions in progress are rolled back.
Graceful Postgres Server Shutdown

Nothing Required. Transactions in progress are rolled back.
Abrupt Postgres Server Crash

Nothing Required. Transactions in progress are rolled back.
Operating System Crash

Nothing Required. Transactions in progress are rolled back. Partial page writes are repaired.
Disk Failure

Restore from previous backup or use PITR.
Accidental DELETE

Recover table from previous backup, perhaps using pg_restore. It is possible to modify the backend code to make deleted tuples visible, dump out the deleted table and restore the original code. All tuples in the table since the previous vacuum will be visible. It is possible to restrict that so only tuples deleted by a specific transaction are visible.
Write-Ahead Log (WAL) Corruption

See pg_resetwal. Review recent transactions and identify any damage, including partially committed transactions.
It may be necessary to create an empty file with the deleted file name so the object can be deleted, and then the object restored from backup.
Accidental DROP TABLE

Restore from previous backup.
Accidental DROP INDEX

Recreate index.
Accidental DROP DATABASE

Restore from previous backup.
Non-Starting Installation

Restart problems are usually caused by write-ahead log problems. See pg_resetwal. Review recent transactions and identify any damage, including partially committed transactions.
Use REINDEX.
Table Corruption

Try reindexing the table. Try identifying the corrupt OID of the row and transfer the valid rows into another table using `SELECT...INTO...WHERE oid != ###`. Use `pageinspect` to analyze the internal structure of the table.
Conclusion
