Outline

1. Installation
2. Configuration
3. Maintenance
4. Monitoring
5. Recovery
1. Installation

- Click-through Installers
  - MS Windows
  - Linux
  - OS X

- Ports
  - RPM
  - DEB
  - PKG
  - other packages

- Source
  - obtaining
  - build options
  - installing
$ initdb /u/pgsql/data
The files belonging to this database system will be owned by user "postgres".
This user must also own the server process.

The database cluster will be initialized with locale "en_US.UTF-8".
The default database encoding has accordingly been set to "UTF8".
The default text search configuration will be set to "english".

Data page checksums are disabled.

fixing permissions on existing directory /u/pgsql/data ... ok
creating subdirectories ... ok
selecting default max_connections ... 100
selecting default shared_buffers ... 128MB
selecting dynamic shared memory implementation ... posix
creating configuration files ... ok
running bootstrap script ... ok
performing post-bootstrap initialization ... ok
syncing data to disk ... ok

WARNING: enabling "trust" authentication for local connections
You can change this by editing pg_hba.conf or using the option -A, or
--auth-local and --auth-host, the next time you run initdb.

Success. You can now start the database server using:

    pg_ctl -D /u/pgsql/data -l logfile start
$ pg_controldata

Starting Postmaster

2018-04-15 07:23:18.172 EDT [12055] LOG: listening on IPv4 address "127.0.0.1", port 5432
2018-04-15 07:23:18.188 EDT [12055] LOG: database system is ready to accept connections

- manually
- pg_ctl start
- on boot
Stopping Postmaster

- manually
- pg_ctl stop
- on shutdown
Connections

- local — unix domain socket
- host — TCP/IP, both SSL or non-SSL
- hostssl — only SSL
- hostnossll — never SSL
Authentication

- trust
- reject
- passwords
  - scram-sha-256
  - md5
  - password (cleartext)
- local authentication
  - socket permissions
  - ’peer’ socket user name passing
  - host ident using local identd
Remote authentication
  - host ident using pg_ident.conf
  - kerberos
    - gss
    - sspi
  - pam
  - ldap
  - radius
  - cert
Access

- hostname and network mask
- database name
- role name (user or group)
- filename or list of databases, role
- IPv6
# pg_hba.conf Default

2. Configuration

https://www.flickr.com/photos/mwichary/
# PostgreSQL configuration file

This file consists of lines of the form:

```
# name = value
```

(The "=" is optional.) Whitespace may be used. Comments are introduced with "#" anywhere on a line. The complete list of parameter names and allowed values can be found in the PostgreSQL documentation.

The commented-out settings shown in this file represent the default values. Re-commenting a setting is NOT sufficient to revert it to the default value; you need to reload the server.
# This file is read on server startup and when the server receives a SIGHUP signal. If you edit the file on a running system, you have to SIGHUP the server for the changes to take effect, run "pg_ctl reload", or execute "SELECT pg_reload_conf()". Some parameters, which are marked below, require a server shutdown and restart to take effect.

# Any parameter can also be given as a command-line option to the server, e.g., "postgres -c log_connections=on". Some parameters can be changed at run time with the "SET" SQL command.

# Memory units: kB = kilobytes Time units: ms = milliseconds
# MB = megabytes s = seconds
# GB = gigabytes min = minutes
# TB = terabytes h = hours
d = days
# The default values of these variables are driven from the -D command-line
# option or PGDATA environment variable, represented here as ConfigDir.

#data_directory = 'ConfigDir'
# use data in another directory

# Valid values are combinations of
# stderr, csvlog, syslog, and eventlog,
# depending on platform. csvlog
# requires logging_collector to be on.

# This is used when logging to stderr:
#logging_collector = off  
# Enable capturing of stderr and csvlog
# into log files. Required to be on for
# csvlogs.
# (change requires restart)

# These are only used if logging_collector is on:
#log_directory = 'log'
# directory where log files are written,
# can be absolute or relative to PGDATA

#log_filename = 'postgresql-%Y-%m-%d_%H%M%S.log'
# log file name pattern,
# can include strftime() escapes

#log_file_mode = 0600
# creation mode for log files,
# begin with 0 to use octal notation
Where To Log (rotation)

#log_truncate_on_rotation = off
# If on, an existing log file with the
# same name as the new log file will be
# truncated rather than appended to.
# But such truncation only occurs on
# time-driven rotation, not on restarts
# or size-driven rotation. Default is
# off, meaning append to existing files
# in all cases.

#log_rotation_age = 1d
# Automatic rotation of logfiles will
# happen after that time. 0 disables.

#log_rotation_size = 10MB
# Automatic rotation of logfiles will
# happen after that much log output.
# 0 disables.
Where to Log (syslog)

#syslog_facility = 'LOCAL0'
#syslog_ident = 'postgres'
#syslog_sequence_numbers = on
#syslog_split_messages = on

# This is only relevant when logging to eventlog (win32):
# (change requires restart)
#event_source = 'PostgreSQL'
When to Log

#client_min_messages = notice

# log_min_messages = warning
When to Log (Continued)

#log_min_error_statement = error
# values in order of decreasing detail:
#   debug5
#   debug4
#   debug3
#   debug2
#   debug1
#   info
#   notice
#   warning
#   error
#   log
#   fatal
#   panic (effectively off)

#log_min_duration_statement = -1
# -1 is disabled, 0 logs all statements and their durations, > 0 logs only statements running at least this number of milliseconds

3. Maintenance
Backup

- File system-level (physical)
  - tar, cpio while shutdown
  - file system snapshot
  - rsync, shutdown, rsync, restart
- pg_dump/pg_dumpall (logical)
- Restore/pg_restore with custom format
Continuous Archiving / Point-In-Time Recovery (PITR)

File System–Level Backup

Continuous Archive (WAL)
1. archive_mode = on
2. wal_level = archive
3. archive_command = 'cp -i %p /mnt/server/pgsql/%f < /dev/null'
4. SELECT pg_start_backup('label');
5. Perform file system-level backup (can be inconsistent)
6. SELECT pg_stop_backup();

`pg_basebackup` does this automatically.
PITR Recovery

File System–Level Backup

Continuous Archive (WAL)
PITR Recovery Procedures

1. Stop postmaster
2. Restore file system-level backup
3. Make adjustments as outlined in the documentation
4. Create recovery.conf
5. `restore_command = 'cp /mnt/server/pgsql/%f %p'`
6. Start the postmaster
Simplify backups and WAL archive file management with:

- `pgBackRest`
- `barman`
Data Maintenance

- **VACUUM (nonblocking)** records free space into .fsm (free space map) files
- **ANALYZE** collects optimizer statistics
- **VACUUM FULL (blocking)** shrinks the size of database disk files
Automating Tasks

Autovacuum handles vacuum and analyze tasks automatically.
Checkpoints

- Write all dirty shared buffers
- Sync all dirty kernel buffers
- Recycle WAL files
- Controlled by `checkpoint_timeout` and `max_wal_size`
4. Monitoring
$ ps -f -U postgres

Miscellaneous Tasks

- Log file rotation, syslog
- Upgrading
  - pg_dump, restore
  - pg_upgrade
  - Slony
- Migration
Administration Tools

- pgadmin
- phppgadmin
External Monitoring Tools

- **Alerting:** check_postgres, tail_n_mail, Nagios
- **Server analysis:** Munin, Cacti, Zabbix, Nagios, MRTG, Prometheus, Grafana
- **Queries:** pg_stat_statements, auto_explain, pgbadger
- **Commercial:** Postgres Enterprise Manager (PEM), Circonus, VividCortex
Monitoring Summary

### Reporting

- **Operating System**: `vmstat`, `iostat`
- **Process/Session**: `ps`, `top –c`, `pg_stat_activity`
- **Query**: `pg_stat_activity.query`, `log_statement`, `log_statement_stats`
- **Parser**: `log_parser_stats`
- **Planner**: `log_planner_stats`
- **Executor**: `log_executor_stats`, `pg_locks`, `log_lock_waits`, `pg_stat_activity.wait_event`

### Altering / Aggregation

- `sar`, `check_postgres`, `log_temp_files`
- `tail_n_mail`
- `pg_stat_statements`, `log_min_duration_statement`, `pgbadger`
- `auto_explain`
- `e.g. pg_stat_all_tables`

*time*
5. Recovery

https://www.flickr.com/photos/coastguardnews/
Nothing Required. Transactions in progress are rolled back.
Graceful Postgres Server Shutdown

Nothing Required. Transactions in progress are rolled back.
Abrupt Postgres Server Crash

Nothing Required. Transactions in progress are rolled back.
Nothing Required. Transactions in progress are rolled back. Partial page writes are repaired.
Disk Failure

Restore from previous backup or use PITR.
Accidental DELETE

Recover table from previous backup, perhaps using pg_restore. It is possible to modify the backend code to make deleted tuples visible, dump out the deleted table and restore the original code. All tuples in the table since the previous vacuum will be visible. It is possible to restrict that so only tuples deleted by a specific transaction are visible.
Write-Ahead Log (WAL) Corruption

See pg_resetwal. Review recent transactions and identify any damage, including partially committed transactions.
It may be necessary to create an empty file with the deleted file name so the object can be deleted, and then the object restored from backup.
Accidental DROP TABLE

Restore from previous backup.
Accidental DROP INDEX

Recreate index.
Accidental DROP DATABASE

Restore from previous backup.
Non-Starting Installation

Restart problems are usually caused by write-ahead log problems. See `pg_resetwal`. Review recent transactions and identify any damage, including partially committed transactions.
Use REINDEX.
Try reindexing the table. Try identifying the corrupt OID of the row and transfer the valid rows into another table using SELECT...INTO...WHERE oid !≠ ###. Use pageinspect to analyze the internal structure of the table.
Conclusion
