This talk explores why Postgres is uniquely capable of functioning as a central database in enterprises. 

*Title concept from Josh Berkus*

1. Object-relational (extensibility)
2. NoSQL
3. Data analytics
4. Foreign data wrappers (database federation)
5. Central role
1. Object-Relational (Extensibility)

Object-relational databases like Postgres support classes and inheritance, but most importantly, they define database functionality as objects that can be easily manipulated.

CREATE EXTENSION isn;

\dT

List of data types

<table>
<thead>
<tr>
<th>Schema</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>

CREATE EXTENSION plpythonu;

\dL

List of languages

<table>
<thead>
<tr>
<th>Name</th>
<th>Owner</th>
<th>Trusted</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plpgsql</td>
<td>postgres</td>
<td>t</td>
<td>PL/pgSQL procedural language</td>
</tr>
<tr>
<td>plpythonu</td>
<td>postgres</td>
<td>f</td>
<td>PL/PythonU untrusted procedural language</td>
</tr>
</tbody>
</table>

http://www.postgresql.org/docs/current/plpython.html
Available Languages

- PL/Java
- PL/Perl
- PL/pgSQL (like PL/SQL)
- PL/PHP
- PL/Python
- PL/R (like SPSS)
- PL/Ruby
- PL/Scheme
- PL/sh
- PL/Tcl
- PL/v8 (JavaScript)
- SPI (C)

http://www.postgresql.org/docs/current/external-pl.html
Specialized Indexing Methods

- BRIN
- BTree
- Hash
- GIN (generalized inverted index)
- GiST (generalized search tree)
- SP-GiST (space-partitioned GiST)

http://www.postgresql.org/docs/current/indexam.html
Index Types Are Defined in the System Catalogs Too

SELECT amname FROM pg_am ORDER BY 1;
    amname
    ------
    brin  
btree
hash
  gin
  gist
spgist

http://www.postgresql.org/docs/current/catalog-pg-am.html
Operators are function calls with left and right arguments of specified types:

\(\text{| Schema | Name | Left arg type | Right arg type | Result type | Description |}\)

\(\text{...}\)

\(\text{pg_catalog | + | integer | integer | integer | add}\)

\(\text{| Schema | Name | Result data type | Argument data types | Type |}\)

\(\text{...}\)

\(\text{pg_catalog | int4pl | integer | integer, integer | normal}\)
Other Extensibility

- Aggregates are defined in `pg_aggregate`, `sum(int4)`
- Casts are defined in `pg_cast`, `int4(float8)`
PostGIS (Geographical Information System)

PL/v8 (server-side JavaScript)

experimentation, e.g., full text search was originally externally developed
Offshoots of Postgres

- Aurora (Amazon)
- AsterDB
- Greenplum
- Informix
- Netezza
- ParAccel
- Postgres XC
- Redshift (Amazon)
- Truviso
- Vertica
- Yahoo! Everest

https://wiki.postgresql.org/wiki/PostgreSQL Derived_databases
http://de.slideshare.net/pgconf/elephant-roads-a-tour-of-postgres-forks
Many databases treat extensions as special cases, with serious limitations. Postgres built-ins use the same API as extensions, so extensions operate just like built-in functionality.
Extensions and Built-In Facilities
Behave the Same

Postgres System Tables

- sum()
- int4
- btree
- PL/pgSQL

Extensions

- ISN
- PostGIS
- PL/R
2. NoSQL
There is no single NoSQL technology. They all take different approaches and have different features and drawbacks:

- Key-value stores, e.g., Redis
- Document databases, e.g., MongoDB (JSON)
- Columnar stores: Cassandra
- Graph databases: Neo4j
Generally, NoSQL is optimized for:

- Fast simple queries
- Auto-sharding
- Flexible schemas
NoSQL Sacrifices

- A powerful query language
- A sophisticated query optimizer
- Data normalization
- Joins
- Referential integrity
- Durability
Are These Drawbacks Worth the Cost?

- **Difficult Reporting** Data must be brought to the client for analysis, e.g., no aggregates or data analysis functions. Schema-less data requires complex client-side knowledge for processing.

- **Complex Application Design** Without powerful query language and query optimizer, the client software is responsible for efficiently accessing data and for data consistency.

- **Durability** Administrators are responsible for data retention.
When Should NoSQL Be Used?

- Massive write scaling is required, more than a single server can provide
- Only simple data access pattern is required
- Additional resource allocation for development is acceptable
- Strong data retention or transactional guarantees are not required
- Unstructured duplicate data that greatly benefits from column compression
When Should Relational Storage Be Used?

- Easy administration
- Variable workloads and reporting
- Simplified application development
- Strong data retention
Postgres has many NoSQL features without the drawbacks:

- Schema-less data types, with sophisticated indexing support
- Transactional schema changes with rapid additional and removal of columns
- Durability by default, but controllable per-table or per-transaction
CREATE TABLE customer (id SERIAL, data JSONB);

INSERT INTO customer VALUES (DEFAULT, '{"name" : "Bill", "age" : 21}');

SELECT data->'name' FROM customer WHERE data->>'age' = '21';

---------
"Bill"
BEGIN WORK;
ALTER TABLE customer ADD COLUMN debt_limit NUMERIC(10,2);
ALTER TABLE customer ADD COLUMN creation_date TIMESTAMP WITH TIME ZONE;
ALTER TABLE customer RENAME TO cust;
COMMIT;
3. Data Analytics

- Aggregates
- Optimizer
- Server-side languages, e.g., PL/R
- Window functions
- Bitmap heap scans
- Tablespace
- Data partitioning
- Materialized views
- Common table expressions (CTE)
- BRIN indexes
- GROUPING SETS, ROLLUP, CUBE
- Just-in-time compilation (JIT)
- Parallelism
- Sharding (in progress)

http://www.slideshare.net/PGExperts/really-big-elephants-postgresql-dw-15833438
Tables from multiple clusters can be collected and synchronized on one cluster using logical replication, and a single table can be broadcast to multiple clusters too.
Foreign data wrappers (SQL MED) allow queries to read and write data to foreign data sources. Foreign database support includes:

- CouchDB
- Informix
- MongoDB
- MySQL
- Neo4j
- Oracle
- Postgres
- Redis

The transfer of joins, aggregates, and sorts to foreign servers is not yet implemented.

http://www.postgresql.org/docs/current/ddl-foreign-data.html
http://wiki.postgresql.org/wiki/Foreign_data_wrappers
Foreign Data Wrappers to Interfaces

- JDBC
- ODBC
- LDAP
Foreign Data Wrappers to Non-Traditional Data Sources

- Files
- HTTP
- AWS S3
- Twitter
CREATE SERVER \textit{postgres\_fdw\_test}
FOREIGN DATA WRAPPER \textit{postgres\_fdw}
OPTIONS (host 'localhost', dbname 'fdw\_test');

CREATE USER MAPPING FOR PUBLIC
SERVER \textit{postgres\_fdw\_test}
OPTIONS (password '');

CREATE FOREIGN TABLE \textit{other\_world} (greeting TEXT)
SERVER \textit{postgres\_fdw\_test}
OPTIONS (table\_name 'world');

\texttt{\textbackslash det}
List of foreign tables
Schema | Table | Server
--------+-------------+-------------------
\textit{public} | \textit{other\_world} | \textit{postgres\_fdw\_test}

Foreign Postgres server name in \textcolor{red}{red}; foreign table name in \textcolor{blue}{blue}
Read and Read/Write Data Sources

- Postgres
  - ora_tab
  - mon_tab
  - tw_tab
- MongoDB
- Oracle
- Twitter
Postgres can rightly take a central place in the data center with its:

- Object-relation flexibility and extensibility
- NoSQL-like workloads
- Powerful data analytics capabilities
- Access to foreign data sources

No other database has all of these key components.
Postgres’s Central Role

- Extensions
- NoSQL
- Postgres Warehouse
- Foreign Data Wrappers
- Window Functions
- Data Partitioning
- Bitmap Scans
- ISN
- PostGIS
- PL/R
- JSON
- Easy DDL
- Sharding
- Oracle
- Twitter
- MongoDB
