Common Table Expressions (CTEs) allow queries to be more imperative, allowing looping and processing hierarchical structures that are normally associated only with imperative languages.

Last updated: November, 2017
Outline

1. Imperative vs. Declarative
2. CTE syntax
3. Recursive CTEs
4. Examples
5. Writable CTEs
In computer science, **imperative** programming is a programming paradigm that describes computation in terms of statements that change a program state. In much the same way that imperative mood in natural languages expresses commands to take action, imperative programs define sequences of commands for the computer to perform.

http://en.wikipedia.org/wiki/Imperative_programming
The term is used in opposition to **declarative** programming, which expresses what the program should accomplish without prescribing how to do it in terms of sequence.
**Imperative**

**BASIC:**

```plaintext
10 PRINT "Hello";
20 GOTO 10
```

**C:**

```c
while (1)
    printf("Hello\n");
```

**Perl:**

```perl
print("Hello\n") while (1);
```
SQL:

```
SELECT 'Hello'
UNION ALL
SELECT 'Hello'
UNION ALL
SELECT 'Hello'
UNION ALL
SELECT 'Hello'

...
```

An infinite loop is not easily implemented in simple SQL.
Imperative Database Options

- Client application code (e.g. libpq, JDBC, DBD::Pg)
- Server-side programming (e.g. PL/pgSQL, PL/Perl, C)
- Common table expressions
WITH [ RECURSIVE ] with_query_name [( column_name [, ...] )] AS ( select ) [, ... ]
SELECT ... 

CTE support was added in Postgres 8.4.
WITH source AS (  
    SELECT 1  
  )  
SELECT * FROM source;  
?column?  
---------  
 1  
(1 row)

The CTE created a source table that was referenced by the outer SELECT. All queries in this presentation can be downloaded from http://momjian.us/main/writings/pgsql/cte.sql
WITH source AS (  
    SELECT 1 AS col1  
)  
SELECT * FROM source;  
col1  
------  
1  
(1 row)  

The CTE returned column is source.col1.
The Column Can Also Be Named in the WITH Clause

WITH source (col1) AS (  
    SELECT 1
  )
SELECT * FROM source;

  col1
-----
  1
(1 row)
WITH source (col2) AS (  
    SELECT 1 AS col1  
)  
SELECT col2 AS col3 FROM source;

<table>
<thead>
<tr>
<th>col3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

The CTE column starts as `col1`, is renamed in the WITH clause as `col2`, and the outer SELECT renames it to `col3`.
Multiple CTE Columns Can Be Returned

WITH source AS (
    SELECT 1, 2
)
SELECT * FROM source;

| column? | column? |
|--------+--------|
| 1      | 2      |

(1 row)
UNION Refresher

```
SELECT 1
UNION
SELECT 1;
?
column?
----------
  1
(1 row)

SELECT 1
UNION ALL
SELECT 1;
?
column?
----------
  1
  1
(2 rows)
```
WITH source AS (  
    SELECT 1, 2
),

    source2 AS (  
    SELECT 3, 4
)

SELECT * FROM source
UNION ALL
SELECT * FROM source2;

?column? | ?column?
----------+----------
  1 |   2
  3 |   4

(2 rows)
WITH source AS (
    SELECT lanname, rolname
    FROM pg_language JOIN pg_roles ON lanowner = pg_roles.oid
)
SELECT * FROM source;

<table>
<thead>
<tr>
<th>lanname</th>
<th>rolname</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>postgres</td>
</tr>
<tr>
<td>c</td>
<td>postgres</td>
</tr>
<tr>
<td>sql</td>
<td>postgres</td>
</tr>
<tr>
<td>plpgsql</td>
<td>postgres</td>
</tr>
</tbody>
</table>

(4 rows)
WITH source AS (  
    SELECT lanname, rolname  
    FROM pg_language JOIN pg_roles ON lanowner = pg_roles.oid  
    ORDER BY lanname
)
SELECT * FROM source
UNION ALL
SELECT MIN(lanname), NULL
FROM source;

<table>
<thead>
<tr>
<th>lanname</th>
<th>rolname</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>postgres</td>
</tr>
<tr>
<td>internal</td>
<td>postgres</td>
</tr>
<tr>
<td>plpgsql</td>
<td>postgres</td>
</tr>
<tr>
<td>sql</td>
<td>postgres</td>
</tr>
<tr>
<td>c</td>
<td></td>
</tr>
</tbody>
</table>
WITH class (oid, relname) AS (  
    SELECT oid, relname  
    FROM pg_class  
    WHERE relkind = 'r'
  )

SELECT class.relname, attname
FROM pg_attribute, class
WHERE class.oid = attrelid
ORDER BY 1, 2
LIMIT 5;

<table>
<thead>
<tr>
<th>relname</th>
<th>attname</th>
</tr>
</thead>
<tbody>
<tr>
<td>pg_aggregate</td>
<td>aggfinalfn</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>aggfnoioid</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>agginitval</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>aggsortop</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>aggtransfn</td>
</tr>
</tbody>
</table>

(5 rows)
CASE
WHEN condition THEN result
ELSE result
END

For example:

```
SELECT col,
    CASE
        WHEN col > 0 THEN 'positive'
        WHEN col = 0 THEN 'zero'
        ELSE 'negative'
    END 'negative'
FROM tab;
```
WITH RECURSIVE source AS (  
    SELECT 1  
) 
SELECT * FROM source; 
?column? 
---------  
  1  
(1 row)

This does not loop because source is not mentioned in the CTE.
This Is an Infinite Loop

SET statement_timeout = '1s';
SET
WITH RECURSIVE source AS (  
    SELECT 1  
    UNION ALL  
    SELECT 1 FROM source
)
SELECT * FROM source;
ERROR: canceling statement due to statement timeout
WITH RECURSIVE source AS (  
  SELECT 1  
  UNION ALL  
  SELECT 1 FROM source  
)

SELECT * FROM source;
WITH RECURSIVE source AS (  
    SELECT 'Hello'
    UNION ALL
    SELECT 'Hello' FROM source
)
SELECT * FROM source;
ERROR: canceling statement due to statement timeout
RESET statement_timeout;
RESET
WITH RECURSIVE source AS (  
   SELECT 'Hello'
     UNION
   SELECT 'Hello' FROM source
)
SELECT * FROM source;
?column?

----------
Hello
(1 row)
WITH RECURSIVE source (counter) AS ( 
  -- seed value
  SELECT 1
  UNION ALL
  SELECT counter + 1
  FROM source
  -- terminal condition
  WHERE counter < 10
  
)
SELECT * FROM source;
Of course, this can be more easily accomplished using `generate_series(1, 10)`.
for (my $i = 1; $i <= 10; $i++) {
    print "$i
";
}
sub f
{
    my $arg = shift;
    print "$arg\n";
    f($arg + 1) if ($arg < 10);
}

f(1);
Perl Recursion Using an Array

my @table;
sub f
{
    my $arg = shift;
    push @table, !defined($arg) ? 1 : $arg;
    f($arg + 1) if ($arg < 10);
}
f();
map {print "$_ \n"} @table;

This is the most accurate representation of CTEs because it accumulates results in an array (similar to a table result).
WITH RECURSIVE source (counter, product) AS (  
    SELECT 1, 1  
    UNION ALL  
    SELECT counter + 1, product * (counter + 1)  
    FROM source  
    WHERE counter < 10  
  )  
SELECT counter, product FROM source;
<table>
<thead>
<tr>
<th>counter</th>
<th>product</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
</tr>
<tr>
<td>4</td>
<td>24</td>
</tr>
<tr>
<td>5</td>
<td>120</td>
</tr>
<tr>
<td>6</td>
<td>720</td>
</tr>
<tr>
<td>7</td>
<td>5040</td>
</tr>
<tr>
<td>8</td>
<td>40320</td>
</tr>
<tr>
<td>9</td>
<td>362880</td>
</tr>
<tr>
<td>10</td>
<td>3628800</td>
</tr>
</tbody>
</table>

(10 rows)
WITH RECURSIVE source (counter, product) AS (  
    SELECT 1, 1  
    UNION ALL  
    SELECT counter + 1, product * (counter + 1)  
    FROM source  
    WHERE counter < 10
)

SELECT counter, product  
FROM source  
WHERE counter = 10;

<table>
<thead>
<tr>
<th>counter</th>
<th>product</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>3628800</td>
</tr>
</tbody>
</table>

(1 row)
my @table;
sub f
{
    my ($counter, $product) = @_; 
    my ($counter_new, $product_new);
    if (!defined($counter)) {
        $counter_new = 1;
        $product_new = 1;
    } else {
        $counter_new = $counter + 1;
        $product_new = $product * ($counter + 1);
    }
    push(@table, [$counter_new, $product_new]);
    f($counter_new, $product_new) if ($counter < 10);
}
f();
map {print "@$_\n" if ($_->[0]) == 10} @table;
String Manipulation Is Also Possible

WITH RECURSIVE source (str) AS (  
    SELECT 'a'  
    UNION ALL  
    SELECT str || 'a'  
    FROM source  
    WHERE length(str) < 10  
  )  
SELECT * FROM source;
str
----------
a
aa
aaa
aaaa
aaaaa
aaaaaa
aaaaaaa
aaaaaaaa
aaaaaaaaa
(10 rows)
WITH RECURSIVE source (str) AS (  
    SELECT 'a'
    UNION ALL
    SELECT str || chr(ascii(substr(str, length(str))) + 1)
    FROM source
    WHERE length(str) < 10
)
SELECT * FROM source;
```
str
------------
a
ab
abc
abcd
abcde
abcdef
abcdefg
abcdefgh
abcdefgh
abcdefghij
(10 rows)
```
WITH RECURSIVE source (counter) AS (  
    SELECT -10  
    UNION ALL  
    SELECT counter + 1  
    FROM source  
    WHERE counter < 10  
)
SELECT repeat(' ', 5 - abs(counter) / 2) ||  
    'X' ||  
    repeat(' ', abs(counter)) ||  
    'X'  
FROM source;
<table>
<thead>
<tr>
<th>?column?</th>
</tr>
</thead>
<tbody>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
<tr>
<td>X         X</td>
</tr>
</tbody>
</table>

(21 rows)
WITH RECURSIVE source (counter) AS ( 
    SELECT -10 
    UNION ALL 
    SELECT counter + 1 
    FROM source 
    WHERE counter < 10 
)

SELECT counter, 
    repeat(' ', 5 - abs(counter) / 2) || 'X' || 
    repeat(' ', abs(counter)) || 'X'
FROM source;

This generates Integers from -10 to 10, and these numbers are used to print an appropriate number of spaces.
<table>
<thead>
<tr>

Prime Factors

The prime factors of $X$ are the prime numbers that must be multiplied to equal a $X$, e.g.:

$10 = 2 \times 5$

$27 = 3 \times 3 \times 3$

$48 = 2 \times 2 \times 2 \times 2 \times 3$

$66 = 2 \times 3 \times 11$

$70 = 2 \times 5 \times 7$

$100 = 2 \times 2 \times 5 \times 5$
WITH RECURSIVE source (counter, factor, is_factor) AS (

Writable CTEs

- Allow data-modification commands (INSERT/UPDATE/DELETE) in WITH clauses (Marko Tiikkaja, Hitoshi Harada)
  - These commands can use RETURNING to pass data up to the containing query.
- Allow WITH clauses to be attached to INSERT, UPDATE, DELETE statements (Marko Tiikkaja, Hitoshi Harada)
- Added in Postgres 9.1

Why Use CTEs

- Allows imperative processing in SQL
- Merges multiple SQL queries and their connecting application logic into a single, unified SQL query
- Improves performance by issuing fewer queries
  - reduces transmission overhead, unless server-side functions are being used
  - reduces parsing/optimizing overhead, unless prepared statements are being used
- Uses the same row visibility snapshot for the entire query, rather than requiring serializable isolation mode
- Adds a optimizer barrier between each CTE and the outer query
  - helpful with writable CTEs
  - can hurt performance when a join query is changed to use CTEs
Conclusion
