Common Table Expressions (CTEs) allow queries to be more imperative, allowing looping and processing hierarchical structures that are normally associated only with imperative languages.
1. Imperative vs. declarative
2. Syntax
3. Recursive CTEs
4. Examples
5. Writable CTEs
6. Why use CTEs
1. Imperative vs. Declarative
In computer science, **imperative** programming is a programming paradigm that describes computation in terms of statements that change a program state. In much the same way that imperative mood in natural languages expresses commands to take action, imperative programs define sequences of commands for the computer to perform.

http://en.wikipedia.org/wiki/Imperative_programming
The term is used in opposition to declarative programming, which expresses what the program should accomplish without prescribing how to do it in terms of sequence.
Imperative

BASIC:

10 PRINT "Hello";
20 GOTO 10

C:

while (1)
    printf("Hello\n");

Perl:

print("Hello\n") while (1);
Declarative

SQL:

```
SELECT 'Hello'
UNION ALL
SELECT 'Hello'
UNION ALL
SELECT 'Hello'
UNION ALL
SELECT 'Hello'
...
```

An infinite loop is not easily implemented in simple SQL.
Imperative Database Options

- Client application code (e.g., libpq, JDBC, DBD::Pg)
- Server-side programming (e.g., PL/pgSQL, PL/Perl, C)
- Common table expressions
2. Syntax
WITH [ RECURSIVE ] with_query_name [ ( column_name [, ...] ) ] AS
( select ) [ , ... ]
SELECT ...
Keep Your Eye on the Red (Text)

https://www.flickr.com/photos/alltheaces/
WITH source AS (  
    SELECT 1  
)
SELECT * FROM source;

?column?

1

The CTE created a source table that was referenced by the outer SELECT. All queries in this presentation can be downloaded from http://momjian.us/main/writings/pgsql/cte.sql.
WITH source AS (
    SELECT 1 AS col1
) 
SELECT * FROM source;

The CTE returned column is source.col1.
The Column Can Also Be Named in the WITH Clause

WITH source (col1) AS (  
    SELECT 1
  )
SELECT * FROM source;

<table>
<thead>
<tr>
<th>col1</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>
WITH source (col2) AS (SELECT 1 AS col1)
    SELECT col2 AS col3 FROM source;

    col3
    -----
       1

The CTE column starts as \textit{col1}, is renamed in the \texttt{WITH} clause as \textit{col2}, and the outer \texttt{SELECT} renames it to \textit{col3}. 
Multiple CTE Columns Can Be Returned

WITH source AS (
    SELECT 1, 2
)
SELECT * FROM source;

<table>
<thead>
<tr>
<th>column?</th>
<th>column?</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>
SELECT 1
UNION
SELECT 1;
?column?
---------
1

SELECT 1
UNION ALL
SELECT 1;
?column?
---------
1
1
WITH source AS (SELECT 1, 2),
    source2 AS (SELECT 3, 4)
SELECT * FROM source
UNION ALL
SELECT * FROM source2;

| ?column? | ?column? |
|----------+----------|
| 1        | 2        |
| 3        | 4        |
WITH source AS (  
    SELECT lanname, rolname  
    FROM pg_language JOIN pg_roles ON lanowner = pg_roles.oid  
)

SELECT * FROM source;

| lanname | rolname |
|---------+---------|
| internal | postgres |
| c       | postgres |
| sql     | postgres |
| plpgsql | postgres |
WITH source AS (  
    SELECT lanname, rolname  
    FROM pg_language JOIN pg_roles ON lanowner = pg_roles.oid  
    ORDER BY lanname
)
SELECT * FROM source
UNION ALL
SELECT MIN(lanname), NULL
FROM source;

<table>
<thead>
<tr>
<th>lanname</th>
<th>rolname</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>postgres</td>
</tr>
<tr>
<td>internal</td>
<td>postgres</td>
</tr>
<tr>
<td>plpgsql</td>
<td>postgres</td>
</tr>
<tr>
<td>sql</td>
<td>postgres</td>
</tr>
<tr>
<td>c</td>
<td></td>
</tr>
</tbody>
</table>
WITH class AS (  
    SELECT oid, relname  
    FROM pg_class  
    WHERE relkind = 'r'  
  )  
SELECT class.relname, attname  
FROM pg_attribute, class  
WHERE class.oid = attrelid  
ORDER BY 1, 2  
LIMIT 5;

<table>
<thead>
<tr>
<th>relname</th>
<th>attname</th>
</tr>
</thead>
<tbody>
<tr>
<td>pg_aggregate</td>
<td>aggfinalfn</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>aggfnoi</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>aggsortop</td>
</tr>
<tr>
<td>pg_aggregate</td>
<td>aggttransf</td>
</tr>
</tbody>
</table>
CASE
WHEN condition THEN result
ELSE result
END

For example:

SELECT col,
    CASE
        WHEN col > 0 THEN 'positive'
        WHEN col = 0 THEN 'zero'
        ELSE 'negative'
    END
FROM tab;
3. Recursive CTEs

https://www.flickr.com/photos/rbh/
WITH RECURSIVE source AS (  
    SELECT 1  
  )  
SELECT * FROM source;  
?column?  
------------  
  1  

This does not loop because source is not mentioned in the CTE.
This Is an Infinite Loop

SET statement_timeout = '1s';

WITH RECURSIVE source AS (
    SELECT 1
    UNION ALL
    SELECT 1 FROM source
)
SELECT * FROM source;
ERROR: canceling statement due to statement timeout
WITH RECURSIVE source AS ( 
  SELECT 1 
  UNION ALL 
  SELECT 1 FROM source 
)
SELECT * FROM source;
WITH RECURSIVE source AS (  
    SELECT 'Hello'  
    UNION ALL  
    SELECT 'Hello' FROM source  
  )  
SELECT * FROM source;
ERROR: canceling statement due to statement timeout

RESET statement_timeout;
WITH RECURSIVE source AS (  
  SELECT 'Hello'
  UNION
  SELECT 'Hello' FROM source
)
SELECT * FROM source;

Hello
WITH RECURSIVE source (counter) AS (  
  -- seed value  
  SELECT 1  
  UNION ALL  
  SELECT counter + 1  
  FROM source  
  -- terminal condition  
  WHERE counter < 10  
)  
SELECT * FROM source;
Of course, this can be more easily accomplished using `generate_series(1, 10)`.
Perl Example

for (my $i = 1; $i <= 10; $i++)
{
    print "$i
";
}
sub f {
    my $arg = shift;
    print "$arg\n";
    f($arg + 1) if ($arg < 10);
}
f(1);
Perl Recursion Using an Array

```perl
my @table;
sub f {
    my $arg = shift // 1;
    push @table, $arg;
    f($arg + 1) if ($arg < 10);
}
f();
map {print "\$_\n"} @table;
```

This is the most accurate representation of CTEs because it accumulates results in an array (similar to a table result).
4. Examples

https://www.flickr.com/photos/82134796@N03/
WITH RECURSIVE source (counter, product) AS ( 
    SELECT 1, 1 
    UNION ALL 
    SELECT counter + 1, product * (counter + 1) 
    FROM source 
    WHERE counter < 10 
)
SELECT counter, product FROM source;
<table>
<thead>
<tr>
<th>counter</th>
<th>product</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
</tr>
<tr>
<td>4</td>
<td>24</td>
</tr>
<tr>
<td>5</td>
<td>120</td>
</tr>
<tr>
<td>6</td>
<td>720</td>
</tr>
<tr>
<td>7</td>
<td>5040</td>
</tr>
<tr>
<td>8</td>
<td>40320</td>
</tr>
<tr>
<td>9</td>
<td>362880</td>
</tr>
<tr>
<td>10</td>
<td>3628800</td>
</tr>
</tbody>
</table>
WITH RECURSIVE source (counter, product) AS ( 
    SELECT 1, 1 
    UNION ALL 
    SELECT counter + 1, product * (counter + 1) 
    FROM source 
    WHERE counter < 10 
) 
SELECT counter, product 
FROM source 
WHERE counter = 10;

<table>
<thead>
<tr>
<th>counter</th>
<th>product</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>3628800</td>
</tr>
</tbody>
</table>
my @table;
sub f {
    my ($counter, $product) = @_;  
    my ($counter_new, $product_new);
    if (!defined($counter)) {
        $counter_new = 1;
        $product_new = 1;
    } else {
        $counter_new = $counter + 1;
        $product_new = $product * ($counter + 1);
    }
    push(@table, [$counter_new, $product_new]);
    f($counter_new, $product_new) if ($counter < 10);
}

f();
map {print "@$_\n" if ($_->[0]) == 10} @table;
WITH RECURSIVE source (str) AS (
    SELECT 'a'
    UNION ALL
    SELECT str || 'a'
    FROM source
    WHERE length(str) < 10
)
SELECT * FROM source;
str
-------------

a
aa
aaa
aaaa
aaaaaa
aaaaaaaa
aaaaaaaaa
aaaaaaaaaa
WITH RECURSIVE source (str) AS ( 
    SELECT 'a' 
    UNION ALL 
    SELECT str || chr(ascii(substr(str, length(str))) + 1) 
    FROM source 
    WHERE length(str) < 10 
) 
SELECT * FROM source;
str
---------
a
ab
abc
abcd
abcde
abcdef
abcdefg
abcdefgh
abcdefghi
abcdefghij
WITH RECURSIVE source (counter) AS (
  SELECT -10
  UNION ALL
  SELECT counter + 1
  FROM source
  WHERE counter < 10
)
SELECT repeat(' ', 5 - abs(counter) / 2) ||
  'X' ||
repeat(' ', abs(counter)) ||
  'X'
FROM source;
WITH RECURSIVE source (counter) AS (
    SELECT -10
    UNION ALL
    SELECT counter + 1
    FROM source
    WHERE counter < 10
)
SELECT counter,
    repeat(' ', 5 - abs(counter) / 2) ||
    'X' ||
    repeat(' ', abs(counter)) ||
    'X'
FROM source;

This generates Integers from -10 to 10, and these numbers are used to print an appropriate number of spaces.
<table>
<thead>
<tr>

5. Writable CTEs

https://www.flickr.com/photos/dmelchordiaz/
Writable CTEs

- Allow data-modification commands (INSERT/UPDATE/DELETE) in WITH clauses
  - These commands can use RETURNING to pass data up to the containing query.
- Allow WITH clauses to be attached to INSERT, UPDATE, DELETE statements
CREATE TEMPORARY TABLE retdemo (x NUMERIC);

INSERT INTO retdemo VALUES (random()), (random()), (random()) RETURNING x;

---------------------
0.00761545216664672
0.85416117589920831
0.10137318633496895

WITH source AS (
   INSERT INTO retdemo
   VALUES (random()), (random()), (random()) RETURNING x
)
SELECT AVG(x) FROM source;

---------------------
0.46403147140517833
WITH source AS ( 
    DELETE FROM retdemo RETURNING x 
) 
SELECT MAX(x) FROM source;
max
---------------------
0.93468171451240821
CREATE TEMPORARY TABLE retdemo2 (x NUMERIC);

INSERT INTO retdemo2 VALUES (random()), (random()), (random());

WITH source (average) AS (
    SELECT AVG(x) FROM retdemo2
)
DELETE FROM retdemo2 USING source
WHERE retdemo2.x < source.average;

SELECT * FROM retdemo2;

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.777186767663807</td>
</tr>
</tbody>
</table>
Recursive WITH to Delete Parts

WITH RECURSIVE source (part_no) AS ( 
    SELECT 2 
    UNION ALL 
    SELECT part.part_no 
    FROM source JOIN part ON (source.part_no = part.parent_part_no) 
) 
DELETE FROM part 
USING source 
WHERE source.part_no = part.part_no;
CREATE TEMPORARY TABLE retdemo3 (x NUMERIC);

INSERT INTO retdemo3 VALUES (random()), (random()), (random());

WITH source (average) AS (
    SELECT AVG(x) FROM retdemo3
),
    source2 AS (
    DELETE FROM retdemo3 USING source
    WHERE retdemo3.x < source.average
    RETURNING x
)
SELECT * FROM source2;

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.185174203012139</td>
</tr>
<tr>
<td>0.209731927141547</td>
</tr>
</tbody>
</table>
CREATE TEMPORARY TABLE orders (order_id SERIAL, name text);

CREATE TEMPORARY TABLE items (order_id INTEGER, part_id SERIAL, name text);

WITH source (order_id) AS (  
  INSERT INTO orders VALUES (DEFAULT, 'my order') RETURNING order_id  
)

INSERT INTO items (order_id, name) SELECT order_id, 'my part' FROM source;

WITH source (order_id) AS (  
  DELETE FROM orders WHERE name = 'my order' RETURNING order_id  
)

DELETE FROM items USING source WHERE source.order_id = items.order_id;
CREATE TEMPORARY TABLE old_orders (order_id INTEGER);

WITH source (order_id) AS (  
    DELETE FROM orders WHERE name = 'my order' RETURNING order_id
), source2 AS (  
    DELETE FROM items USING source WHERE source.order_id = items.order_id
)

INSERT INTO old_orders SELECT order_id FROM source;
6. Why Use CTEs

- Allows imperative processing in SQL
- Merges multiple SQL queries and their connecting application logic into a single, unified SQL query
- Improves performance by issuing fewer queries
  - reduces transmission overhead, unless server-side functions are being used
  - reduces parsing/optimizing overhead, unless prepared statements are being used
- Uses the same row visibility snapshot for the entire query, rather than requiring serializable isolation mode
- Adds a optimizer barrier between each CTE and the outer query
  - helpful with writable CTEs
  - can hurt performance when a join query is changed to use CTEs
Conclusion
