Join Methods

- Nested Loop
  - With Inner Sequential Scan
  - With Inner Index Scan
- Hash Join
- Merge Join
Nested Loop Join with Inner Sequential Scan

No Setup Required

Used For Small Tables
Nested Loop Join with Inner Index Scan

No Setup Required

Index Must Already Exist
Hash Join

Hashed

Must fit in Main Memory
Merge Join

Ideal for Large Tables

An Index Can Be Used to Eliminate the Sort
**Path Structure**

```c
typedef struct Path {
    NodeTag     type;
    RelOptInfo *parent; /* the relation this path can build */

Index Tuple Structure

- **tid**: heap tuple id (page / item)
- **infomask**: index flags
- **hoff**: length of index tuple
- **key**
- **subkey**
Index Types
(Access Methods)

- BRIN
- BTree
- Hash
- GIN
- GiST
- SP-GiST
Transaction Status

**Tuple Creation XID**: 15
**Expiration XID**: 27
Multi-Version Concurrency Control

- Each query sees only transactions completed before it started
- On query start, PostgreSQL records:
  - the transaction counter
  - all transaction id’s that are in-process
- In a multi-statement transaction, a transaction’s own previous queries are also visible
- The above assumes the default read committed isolation level
MVCC Tuple Requirements

- Visible tuples must have a creation transaction id that:
  - is a committed transaction
  - is less than the transaction counter stored at query start and
  - was not in-process at query start

- Visible tuples must also have an expire transaction id that:
  - is blank or aborted or
  - is greater than the transaction counter stored at query start or
  - was in-process at query start
MVCC Behavior

UPDATE is effectively a DELETE and an INSERT.

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

INSERT

DELETE

old (delete)

UPDATE

new (insert)
Internally, the creation xid is stored in the system column ‘xmin’, and expire in ‘xmax’.

**MVCC Examples**

<table>
<thead>
<tr>
<th>Create–Only</th>
<th>Visible</th>
<th>Sequential Scan</th>
<th>Create &amp; Expire</th>
<th>Invisible</th>
<th>Snapshot</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cre 30 Exp</td>
<td></td>
<td></td>
<td>Cre 30 Exp 80</td>
<td>Invisible</td>
<td></td>
</tr>
<tr>
<td>Cre 50 Exp</td>
<td>Invisible</td>
<td></td>
<td>Cre 30 Exp 75</td>
<td>Invisible</td>
<td></td>
</tr>
<tr>
<td>Cre 110 Exp</td>
<td>Invisible</td>
<td></td>
<td>Cre 30 Exp 110</td>
<td>Visible</td>
<td></td>
</tr>
</tbody>
</table>

Open Transactions: 25, 50, 75

For simplicity, assume all other transactions are committed.

The highest-numbered committed transaction: 100
