## List Support Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfirst</td>
<td>returns value stored in List</td>
</tr>
<tr>
<td>lnext</td>
<td>returns pointer to next in List</td>
</tr>
<tr>
<td>foreach</td>
<td>loops through List</td>
</tr>
<tr>
<td>length</td>
<td>returns length of List</td>
</tr>
<tr>
<td>nth</td>
<td>returns nth element from List</td>
</tr>
<tr>
<td>makeList1</td>
<td>creates a new list</td>
</tr>
<tr>
<td>lcons</td>
<td>adds value to front of List</td>
</tr>
<tr>
<td>lappend</td>
<td>appends value to end of List</td>
</tr>
<tr>
<td>nconc</td>
<td>concatenates two Lists</td>
</tr>
</tbody>
</table>

There are versions of these functions for storing integers rather than pointers.

Join Methods

- Nested Loop
  - With Inner Sequential Scan
  - With Inner Index Scan
- Hash Join
- Merge Join
Nested Loop Join with Inner Sequential Scan

No Setup Required

Used For Small Tables
Nested Loop Join with Inner Index Scan

No Setup Required

Index Must Already Exist
Hash Join

Must fit in Main Memory
Merge Join

Ideal for Large Tables
An Index Can Be Used to Eliminate the Sort

</tbody>
</table>

Tuple Creation XID: 15  Expiration XID: 27
xmin xmax

Transaction Id (XID)
- 00 In Progress
- 01 Aborted
- 10 Committed
Multi-Version Concurrency Control

- Each query sees only transactions completed before it started
- On query start, PostgreSQL records:
  - the transaction counter
  - all transaction id’s that are in-process
- In a multi-statement transaction, a transaction’s own previous queries are also visible
- The above assumes the default *read committed isolation level*

https://momjian.us/main/presentations/internals.html#mvcc
MVCC Tuple Requirements

- Visible tuples must have a creation transaction id that:
  - is a committed transaction
  - is less than the transaction counter stored at query start and
  - was not in-process at query start
- Visible tuples must also have an expire transaction id that:
  - is blank or aborted or
  - is greater than the transaction counter stored at query start or
  - was in-process at query start
MVCC Behavior

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td></td>
</tr>
</tbody>
</table>

- INSERT

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td>47</td>
</tr>
</tbody>
</table>

- DELETE

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>64</td>
<td>78</td>
</tr>
</tbody>
</table>

old (delete)

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>78</td>
<td></td>
</tr>
</tbody>
</table>

new (insert)

UPDATE is effectively a DELETE and an INSERT.
Internally, the creation xid is stored in the system column ‘xmin’, and expire in ‘xmax’.

**MVCC Examples**
