  firstname
  -------------------
      Sandy
(1 row)
Query in Libpq

test=> SELECT firstname
     test-> FROM friend
     test-> WHERE age = 33;

Breakpoint 1, PQexec (conn=0x807a000,
     query=0x8081200  "SELECT firstname
FROM friend
WHERE age = 33;")
     at fe-exec.c:1195
Libpq

Diagram showing the interaction between:
- User Terminal
- Application Code
- Libpq
- PostgreSQL Database Server

Flow of information:
- Queries from User Terminal to Application Code, then to Libpq, and finally to PostgreSQL Database Server.
- Results from PostgreSQL Database Server to Libpq, then to Application Code, and finally to User Terminal.

### List Support Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfirst</td>
<td>returns value stored in List</td>
</tr>
<tr>
<td>lnext</td>
<td>returns pointer to next in List</td>
</tr>
<tr>
<td>foreach</td>
<td>loops through List</td>
</tr>
<tr>
<td>length</td>
<td>returns length of List</td>
</tr>
<tr>
<td>nth</td>
<td>returns nth element from List</td>
</tr>
<tr>
<td>makeList1</td>
<td>creates a new list</td>
</tr>
<tr>
<td>lcons</td>
<td>adds value to front of List</td>
</tr>
<tr>
<td>lappend</td>
<td>appends value to end of List</td>
</tr>
<tr>
<td>nconc</td>
<td>concatenates two Lists</td>
</tr>
</tbody>
</table>

There are versions of these functions for storing integers rather than pointers.

Join Methods

• Nested Loop
  • With Inner Sequential Scan
  • With Inner Index Scan
• Hash Join
• Merge Join
Nested Loop Join with Inner Sequential Scan

No Setup Required

Used For Small Tables
Nested Loop Join with Inner Index Scan

No Setup Required

Index Must Already Exist
Hash Join

Must fit in Main Memory
Merge Join

Ideal for Large Tables
An Index Can Be Used to Eliminate the Sort

Tuple Creation XID: 15 Expiration XID: 27

Transaction Id (XID): 00 In Progress

Commit: 10 Committed

Abort: 01 Aborted
• Each query sees only transactions completed before it started
• On query start, PostgreSQL records:
  • the transaction counter
  • all transaction id’s that are in-process
• In a multi-statement transaction, a transaction’s own previous queries are also visible
• The above assumes the default *read committed isolation level*
Visible tuples must have a creation transaction id that:
- is a committed transaction
- is less than the transaction counter stored at query start and
- was not in-process at query start

Visible tuples must also have an expire transaction id that:
- is blank or aborted or
- is greater than the transaction counter stored at query start or
- was in-process at query start
UPDATE is effectively a DELETE and an INSERT.

</table>

Visible

Invisible

Sequential Scan

Snapshot

The highest–numbered committed transaction: 100

Open Transactions: 25, 50, 75

For simplicity, assume all other transactions are committed.

Internally, the creation xid is stored in the system column ‘xmin’, and expire in ‘xmax’.
typedef struct SnapshotData
{
    TransactionId xmin; /* XID < xmin are visible to me */
    TransactionId xmax; /* XID >= xmax are invisible to me */
    uint32     xcnt;    /* # of xact below */
    TransactionId *xip; /* array of xacts in progress */
    ItemPointerData tid; /* required for Dirty snapshot ¯
                          
} SnapshotData;
Proc Structure

```c
struct proc
{
    /* proc->links MUST BE FIRST IN STRUCT (see ProcSleep,ProcWakeup,etc) */
