List Support Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfirst</td>
<td>returns value stored in List</td>
</tr>
<tr>
<td>lnext</td>
<td>returns pointer to next in List</td>
</tr>
<tr>
<td>foreach</td>
<td>loops through List</td>
</tr>
<tr>
<td>length</td>
<td>returns length of List</td>
</tr>
<tr>
<td>nth</td>
<td>returns nth element from List</td>
</tr>
<tr>
<td>makeList1</td>
<td>creates a new list</td>
</tr>
<tr>
<td>lcons</td>
<td>adds value to front of List</td>
</tr>
<tr>
<td>lappend</td>
<td>appends value to end of List</td>
</tr>
<tr>
<td>nconc</td>
<td>concatenates two Lists</td>
</tr>
</tbody>
</table>

There are versions of these functions for storing integers rather than pointers.

Tuple: Creation XID: 15  Expiration XID: 27

xmin   xmax
Multi-Version Concurrency Control

- Each query sees only transactions completed before it started
- On query start, PostgreSQL records:
  - the transaction counter
  - all transaction id’s that are in-process
- In a multi-statement transaction, a transaction’s own previous queries are also visible
- The above assumes the default \textit{read committed isolation level}

https://momjian.us/main/presentations/internals.html#mvcc
MVCC Tuple Requirements

• Visible tuples must have a creation transaction id that:
  • is a committed transaction
  • is less than the transaction counter stored at query start \textit{and}
  • was not in-process at query start

• Visible tuples must \textit{also} have an expire transaction id that:
  • is blank \textit{or} aborted \textit{or}
  • is greater than the transaction counter stored at query start \textit{or}
  • was in-process at query start
UPDATE is effectively a DELETE and an INSERT.
Internally, the creation xid is stored in the system column ‘xmin’, and expire in ‘xmax’.
