Last updated: February, 2020
SELECT firstname
FROM friend
WHERE age = 33;
Query in Psql

test=> SELECT firstname
    FROM friend
    WHERE age = 33;

    firstname

    ---------------
    Sandy
    (1 row)
test=> SELECT firstname
    test-> FROM friend
    test-> WHERE age = 33;

[ query is processed ]

firstname
-------------
  Sandy
(1 row)
Query in Libpq

test=> SELECT firstname
    test=> FROM friend
    test=> WHERE age = 33;

Breakpoint 1, PQexec (conn=0x807a000,
        query=0x8081200 "SELECT firstname
FROM friend
WHERE age = 33;")

### Transaction Status

**pg_clog**

<table>
<thead>
<tr>
<th>XID</th>
<th>Status flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>100010</td>
</tr>
<tr>
<td>004</td>
<td>101000</td>
</tr>
<tr>
<td>008</td>
<td>101000</td>
</tr>
<tr>
<td>012</td>
<td>100011</td>
</tr>
<tr>
<td>016</td>
<td>100010</td>
</tr>
<tr>
<td>020</td>
<td>101000</td>
</tr>
<tr>
<td>024</td>
<td>101000</td>
</tr>
<tr>
<td>028</td>
<td>000100</td>
</tr>
</tbody>
</table>

**Transaction Id (XID):**
- 000: In Progress
- 004: Committed
- 008: Aborted

**Xmin**
- Creation XID: 15

**Xmax**
- Expiration XID: 27
Multi-Version Concurrency Control

- Each query sees only transactions completed before it started.
- On query start, PostgreSQL records:
  - the transaction counter
  - all transaction id’s that are in-process
- In a multi-statement transaction, a transaction’s own previous queries are also visible.
- The above assumes the default *read committed isolation level*.
MVCC Tuple Requirements

- Visible tuples must have a creation transaction id that:
  - is a committed transaction
  - is less than the transaction counter stored at query start and
  - was not in-process at query start

- Visible tuples must also have an expire transaction id that:
  - is blank or aborted or
  - is greater than the transaction counter stored at query start or
  - was in-process at query start
UPDATE is effectively a DELETE and an INSERT.

---

**MVCC Behavior**

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td>40</td>
<td>INSERT</td>
</tr>
<tr>
<td>40</td>
<td>47</td>
<td>DELETE</td>
</tr>
<tr>
<td>64</td>
<td>78</td>
<td>old (delete)</td>
</tr>
<tr>
<td>78</td>
<td>78</td>
<td>new (insert)</td>
</tr>
</tbody>
</table>
Internally, the creation xid is stored in the system column ‘xmin’, and expire in ‘xmax’.

**Create–Only**

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>50</td>
<td></td>
</tr>
<tr>
<td>110</td>
<td></td>
</tr>
</tbody>
</table>

**Create & Expire**

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>80</td>
</tr>
<tr>
<td>30</td>
<td>75</td>
</tr>
<tr>
<td>30</td>
<td>110</td>
</tr>
</tbody>
</table>

**Sequential Scan**

**Snapshot**

The highest-numbered committed transaction: 100

Open Transactions: 25, 50, 75

For simplicity, assume all other transactions are committed.
