Join Methods

- Nested Loop
  - With Inner Sequential Scan
  - With Inner Index Scan
- Hash Join
- Merge Join
Nested Loop Join with Inner Sequential Scan

No Setup Required

Used For Small Tables
Nested Loop Join with Inner Index Scan

No Setup Required

Index Must Already Exist
Hash Join

Outer
- aay
- aag
- aak
- aar

Inner
- aak → aas
- aam → aay → aar
- aao → aaw

Hashed

Must fit in Main Memory
Merge Join

Ideal for Large Tables

An Index Can Be Used to Eliminate the Sort
**Path Structure**

<td>1 0 0 1 0 0 1 0</td>
</tr>
</tbody>
</table>

- **00** In Progress
- **01** Aborted
- **10** Committed

**Transaction Id (XID)**

**Tuple Creation XID**: 15
**Expiration XID**: 27

**xmin**

**xmax**
Multi-Version Concurrency Control

- Each query sees only transactions completed before it started
- On query start, PostgreSQL records:
  - the transaction counter
  - all transaction id’s that are in-process
- In a multi-statement transaction, a transaction’s own previous queries are also visible
- The above assumes the default *read committed isolation level*
MVCC Tuple Requirements

- Visible tuples must have a creation transaction id that:
  - is a committed transaction
  - is less than the transaction counter stored at query start \textit{and}
  - was not in-process at query start

- Visible tuples must \textit{also} have an expire transaction id that:
  - is blank \textit{or} aborted \textit{or}
  - is greater than the transaction counter stored at query start \textit{or}
  - was in-process at query start
**MVCC Behavior**

<table>
<thead>
<tr>
<th>Cre</th>
<th>Exp</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td></td>
<td>INSERT</td>
</tr>
<tr>
<td>40</td>
<td>47</td>
<td>DELETE</td>
</tr>
<tr>
<td>64</td>
<td>78</td>
<td>old (delete)</td>
</tr>
<tr>
<td>78</td>
<td></td>
<td>new (insert)</td>
</tr>
</tbody>
</table>

UPDATE is effectively a DELETE and an INSERT.
Internally, the creation xid is stored in the system column ‘xmin’, and expire in ‘xmax’.

**MVCC Examples**

Create–Only

<table>
<thead>
<tr>
<th></th>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visible</td>
<td>30</td>
<td></td>
</tr>
<tr>
<td>Invisible</td>
<td>50</td>
<td></td>
</tr>
<tr>
<td>Invisible</td>
<td>110</td>
<td></td>
</tr>
</tbody>
</table>

Create & Expire

<table>
<thead>
<tr>
<th></th>
<th>Cre</th>
<th>Exp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invisible</td>
<td>30</td>
<td>80</td>
</tr>
<tr>
<td>Visible</td>
<td>30</td>
<td>75</td>
</tr>
<tr>
<td>Visible</td>
<td>30</td>
<td>110</td>
</tr>
</tbody>
</table>

Sequential Scan

**Snapshot**

The highest-numbered committed transaction: 100

Open Transactions: 25, 50, 75

For simplicity, assume all other transactions are committed.
